Introduction

2008 Facility Condition Assessment

As part of a Prince George's County Public Schools (PGCPS) initiative, Parsons 3D/International (Parsons) conducted a Level 1, General Facility Condition Assessment, on 184 schools identified as First Priority Projects (51-100 years old), Second Priority Projects (31-50 years old), and Third Priority Projects (16-30 years old) in 2008.

A Level 1, General Facility Condition Assessment, is defined as an assessment of the various building systems that make up the facility, for example, foundation systems, structural systems, roofing systems, and heating, ventilation, and air conditioning (HVAC) systems. The work involved gathering information such as make, model, and installation dates of various systems. Deficiencies were generated at the systems level and were based on an individual system's installation date and its expected useful life.

The purpose of this assessment was to help PGCPS define capital renewal and deferred maintenance funding requirements.

According to the 2008 assessment, PGCPS' school facilities had an average Facility Condition Index (FCI) of 53.94%, which represents the relative physical condition of facilities (cost of needed repairs divided by replacement value). An FCI greater than 75% is considered poor by industry standards.

2012 Assessment Update

In June 2012, PGCPS engaged Parsons to conduct a desk top update of the 2008 assessment report by incorporating all construction repair, renovation or new work into the current database, thereby updating each facility's FCI score.

This update includes the original 184 facilities along with two replacement schools where the original buildings were retained (Greenbelt Middle School and Fairmont Heights High School).

Instead of the Priority groups used in 2008, the 186 facilities have been grouped in the updated database by current use or function:

- Academies (4)
- Elementary Schools (110)
- Middle Schools (24)
- High Schools (22)
- Special Centers and Schools (9)
- Other (17)

The original buildings for Greenbelt Middle School and Fairmont Heights High School are included in the "Other" category while the new replacement facilities are part of the active school groups (i.e., Middle Schools and High Schools).

Since 2008, PGCPs has completed or commenced numerous large capital projects including:

- Replacement schools for Avalon Elementary, Henry G Ferguson Elementary, Greenbelt Middle, Fairmont Heights High, and Oxon Hill High
- New additions at Crossland High, Duval High, Laurel High, Parkdale High, and Potomac High
- Major renovations and additions at Doswell E Brooks Elementary and Eugene Burroughs Middle
- Open space/pod conversions at 16 elementary and middle schools
- Science laboratory renovations at 9 high schools

In addition, many system update projects (i.e., systemic projects) have been completed, planned or are in progress. These projects include replacements of roofs, chillers, boilers and unit ventilators at numerous schools. Other program initiatives involving multiple schools include parking lot improvements and expansions, kitchen and food service upgrades, kitchen grease trap installations, lead remediation, ADA upgrades, and security upgrades including camera replacements.

In 2007, PGCPs initiated its energy savings performance contract. This program, utilizing Pepco Energy Services and Johnson Controls, Inc., is focused on energy conservation measures including the installation of energy-efficient heating and cooling systems, steam trap replacements, energy-efficient transformers, domestic hot water systems, lighting upgrades and building automation controls systems. The overall project, which includes more than 200 facilities, will increase the school system's energy savings, reduce total energy usage by 20%, reduce total water usage by 30%, and reduce the school system's total emissions by approximately 20,000 metric tons each year.

The major renovation and addition projects in design for Glenarden Woods Elementary and Samuel Chase Elementary have not been included as part of this condition assessment desk top update. Both are currently planned for construction completion in 2017. Also, the projects included in the Special Education Inclusion Initiative have not been included in this assessment update, as these projects are still in early design phases or in programming at this time. Currently, this initiative includes the following schools: Clinton Grove Elementary, Buck Lodge Middle, Charles Carroll Middle, Stephen Decatur Middle, Duval High, and C. Elizabeth Rieg, James E. Duckworth, and Margaret Brent Regional Schools.

Capital Program information for Fiscal Years 2009 to 2013 was used during the desktop update. A listing of the various documents reviewed as part of this effort is provided in Attachment 1.

Overview of Findings

Based on this assessment update, PGCPs' school facilities now have an average FCI of 49.52% with 3 facilities in poor condition, 153 facilities in fair condition and 30 facilities in good condition. The 186 facilities have a current replacement cost of \$4.29 billion and total 16.0 million gross square feet.

Deferred Maintenance Funding Need: The total rough order of magnitude budget required to address the current backlog of repair and renovations to school buildings is approximately \$2.13 billion. This cost reflects, to a great extent, the aging condition of facilities.

Capital Renewal Funding Need: In addition to the current backlog, the future continuing aging of facilities and their systems will add approximately \$715 million in additional funding needed over the next 10 years. The current FCI of 49.52% would deteriorate to 69.18% if no funding was applied to renew expiring facility systems, as shown in Figure 6 at the end of this report.

This summary report summarizes the findings of all school buildings assessed in 2007-2008 and updated in 2012 with the following reports:

- Cost Model and Estimates

- Facility Condition Index (FCI)

- Cost Estimate Summary by Building System

- Capital Renewal Summary

- Multi-scenario 10-year Funding Projections

Laurel High School New Addition

Cost Models and Estimates

Cost Models

The summary of the cost models developed for the building systems is noted below (See Attachment 2 for details):

Figure 1 – Cost Model Summary at UNIFORMAT Level 1 As Shown in Database

Cost Estimates

The cost and budget estimates in this report are order-of-magnitude¹ repair estimates for full or partial replacement of expired building systems or elements, out-of-cycle repairs, and modifications. In some cases, the total of these estimates may exceed a facility's Current Replacement Value—an indicator that it may be more economical to replace a facility than to repair it. The cost estimates are taken from two sources. The first source is the **2012 RS Means Square Foot Cost for Construction Estimating Guide** which provides the square foot unit cost estimate for each of the facility systems. The second source is a comparison of the national RS Means unit cost to the actual, local cost of construction being paid by PGCPs.

The total project cost is composed of “hard” and “soft” costs. Hard costs are those associated with actual construction. Soft costs or additional costs are necessary to accomplish the corrective work but are not directly attributable to the deficient system's direct construction cost, which are often referred to as “hard cost”. The components included in the soft costs vary by owner but usually include architect and contractor fees, surveys, permits, material testing, contingencies and other owner-incurred costs necessary to fully develop and build a facility. The soft costs do not include non-fixed furnishings, for example, decorations, books, and computers.

The soft costs used for this assessment are shown in Table 2 below. The soft cost factors shown at the bottom of the table are not summations of the individual cost parameters but are calculated with an integrated formula that incorporates the agreed percentages for each cost parameter.

Table 2-Soft Cost Breakdown

Soft Costs	
Cost Parameter	Standard
AE Fees	10.0%
Bonds & Insurance	2.0%
Commissioning	5.0%
Contingency	5.0%
General Conditions O&P	12.0%
Hazardous Materials	3.0%
Materials Testing	0.5%
Permits and Fees	5.0%
Program Management/Administration	5.0%
Calculated Soft Cost Factor	52.1%

¹ Order of Magnitude is a rough approximation, made with a degree of knowledge and confidence that the estimated figure falls within a reasonable range of cost values.

Facility Condition Index

Using Parsons Energy and Condition Management Estimation Technology (eCOMET) assessment software, we have used Facility Condition Index (FCI) and Extended Facility Condition Indices (EFCI) to score or rate facilities. Comparisons of facility condition can be made between any of the facilities in the County because these scores are calculated in a consistent manner from a common database.

Facility Condition Index

One of the useful results of the assessment process is the determination of the Facility Condition Index (FCI). The FCI is a simple measurement of a facility's condition represented by the ratio of the cost to correct a facility's deficiencies to the current replacement value of the facility as shown in the following formula:

$$\frac{\text{Current Cost of Repairs}}{\text{Replacement Value}}$$

For example, if a building's replacement value is \$1,000,000 and the cost of correcting its existing deficiencies is \$100,000, the building's FCI is $\$100,000 \div \$1,000,000$, or 10 percent. The FCI is particularly useful when comparing similar facilities or schools within the same portfolio. Parsons has assessed over a 3 billion square feet for institutional and government clients across the country and based on our experience, we have developed the following table (see Table 3 below) for interpreting FCI results for schools.

Table 3 – Interpreting FCI Results

Assessed Condition	FCI Range
Good	0 to 40%
Fair	40 to 75%
Poor	> 75%

Extended Facility Condition Index

The Extended Facility Condition Index (EFCI) is similar in nature to the FCI with one exception. Whereas the formula for computing the FCI is the current cost of repairs divided by the replacement value of the facility, the EFCI calculation uses the following formula:

$$\frac{\text{Current Cost of Repairs} + \text{Projected Capital Renewal}}{\text{Replacement Value}} = \text{Total Deficiencies}$$

The estimated cost to repair current deficiencies at Prince George's County school facilities is approximately \$2.13 billion while the estimated replacement value of the facilities is approximately \$4.29 billion. Table 4, Detailed Cost and FCI Analysis by Schools on the next page, provides an in-depth analysis of the assessment results by school. The costs shown in Table 4 include upgrading all school building systems that are beyond their expected useful life and correcting current deficiencies. Further detail of the deficiency costs for each school is provided in Attachment 3.

Valley View Elementary	52,431	\$9,220,249	\$13,774,197	66.94%	77.70%

Table 4 shows that the FCI ranges from 0.00% for replacement schools to 79.74%, which according to Table 3 indicates facilities range from very good to poor condition. Also from Figure 2 below, FCI by Building Age for All Schools, it is evident that most of the school buildings lie in between 40% and 70% FCI range and are in fair condition. The FCI information shown is consistent with our experience considering the ages of the facilities.

Figure 2 – FCI by Building Age for All Schools

The accepted practice within the assessment field is to consider replacing rather than repairing a building when the FCI approaches or exceeds the 75% range. For facilities with an FCI in or near this range, the master capital planning process should carefully weigh issues such as:

- Student population (current versus projected) of the school
- General condition of foundations and superstructures
- Needs for additional space
- Appropriateness of current location

According to this facility condition assessment update, there are three (3) schools that have FCI values greater than 75%. They are: Croom Vocational High, Thomas Addison Alternative School, and Tulip Grove Elementary. Three additional school facilities have buildings with FCI values greater than 75% although the overall FCI for the school is in the Fair category: Apple Grove Elementary (1967 building), Columbia Park Elementary (1989 modular classrooms), and Montpelier Elementary (1968 building). It is also noted that Margaret Brent Regional has an FCI just below 75% at 74.92%.

Greenbelt Middle School Replacement

Cost Estimate Summary by Building System

The current identified deficiencies can be summarized by major building systems. Figure 3 shows the breakdown of the estimated deficiency costs for PGCPs facilities by the UNIFORMAT Level 2 major systems. Table 5 provides the estimated deficiency costs for each major system.

See Attachment 4, Deficiency Estimate Report, for a more detailed breakdown on each system.

Much of the cost identified by this facility condition assessment update is associated with HVAC, electrical systems, and interior finishes. Costs pertaining to HVAC systems can be further broken down into Terminal & Package Units, heat generating systems, cooling generating systems, and distribution systems. Terminal & Package Units costs are typically for adding or replacing unit ventilators, unit heaters, radiant heaters, window or through-the-wall air conditioners, heat pumps, air handling units, furnace, and rooftop air conditioners.

Figure 3 – PGCPs Cost Estimate Breakdown by Building System

Table 5 – PGCPs Cost Estimate Summary by Building System

Major System	% of Costs	Estimated Deficiency Costs
Substructure	0%	\$291,330
Foundations	0.01%	\$255,888
Basement Construction	0.00%	\$35,442
Shell	8%	\$160,826,474
Superstructure	0.07%	\$1,452,190
Exterior Enclosure	4.42%	\$93,985,143
Roofing	3.07%	\$65,389,141
Interiors	24%	\$506,157,038
Interior Construction	4.45%	\$94,649,290
Stairs	0.11%	\$2,299,719
Interior Finishes	19.24%	\$409,208,029
Services	60%	\$1,283,634,542
Conveying	0.38%	\$8,138,592
Plumbing	8.60%	\$182,942,204
HVAC	34.10%	\$725,192,213
Fire Protection	3.45%	\$73,433,909
Electrical	13.82%	\$293,927,624
Equipment & Furnishings	4%	\$88,346,745
Equipment	4.15%	\$88,346,745
Furnishings	0.00%	\$0
Special Construction	2%	\$46,447,419
Special Construction	2.18%	\$46,447,419
Selective Building Demolition	0.00%	\$0
Building Sitework	2%	\$40,948,197
Site Preparation	0.00%	\$0
Site Improvements	1.62%	\$34,488,213
Site Mechanical Utilities	0.30%	\$6,459,985
Site Electrical Utilities	0.00%	\$0
Other Site Construction	0.00%	\$0
Total	100.00%	\$2,126,651,745

The heat generating systems include costs for repair or replacement of boilers, pipe insulation, and pumps; the cooling generating systems include chillers, cooling towers, evaporative coolers, pipe insulation, and pumps. The deficiency dollars associated with distribution systems include costs for replacing supply and return air systems, air handling units, ductwork, and exhaust systems. The electrical system costs are typically associated with replacing service panels or branch circuit and replacing light fixtures.

Interior finishes are broken down into ceiling, wall, and floor finishes. The specific systems with the highest deficiency cost estimates include VAT and VCT flooring, acoustical ceilings, paint, tile flooring, and carpet.

Capital Renewal Summary

An integral part of this report is a look toward the future. Having identified today's needs, a forecast of future system depreciation was prepared. This forecast assists in the creation of budgets for future capital renewal requirements.

Future capital renewal requirements are estimated by taking the cost of a particular system renewal and forecasting the date of renewal by determining the expected life; we breakdown all building components in our cost models using this same logic. The information generated by the cost models allow us to assess the remaining life of each main system for every school and to forecast the expected time of replacement of those systems. Although the cost models do not provide perfect information, they do produce a reasonable approximation of the expected cost for system replacement. Figure 4 shows the 20 year projection for capital renewal funding, excluding current deficiencies.

This process results in defining replacement projects needed in order to eliminate deferred maintenance and restore functionally obsolete facilities to usable condition. Over the life of a building, there are spikes in capital renewal due to building systems expiring and the need to reinvest in the building's functionality.

See Attachment 5 for renewal costs of building systems, e.g., roofs, walls, plumbing systems, electrical systems, for all schools.

Figure 4 – Capital Renewal Forecast for Prince George's County Schools

Because the forecast is based on the existing building systems, the above graph helps monitor the annual expenditures and improve the management of building conditions.

Multi-scenario 10-year Funding Projections

Figure 5, Facility Funding vs. FCI for PGCPs, shows the total funding requirements over the next 10 years for three funding scenarios. For example, Funding Plan 1 shows the annual funding needed to maintain the current FCI; Funding Plan 2 shows the annual funding needed to reduce the overall FCI to 35%; and Funding Plan 3 shows annual funding needed to reduce the overall FCI to 17%. Simple adjustments to the target FCI within the eCOMET software will allow PGCPs decision makers to create multiple “what if” scenarios that will provide them with a graphic illustration of each possible funding decision. The table below list the values used to compile the chart.

Figure 5 – Facility Funding vs. FCI for PGCPs

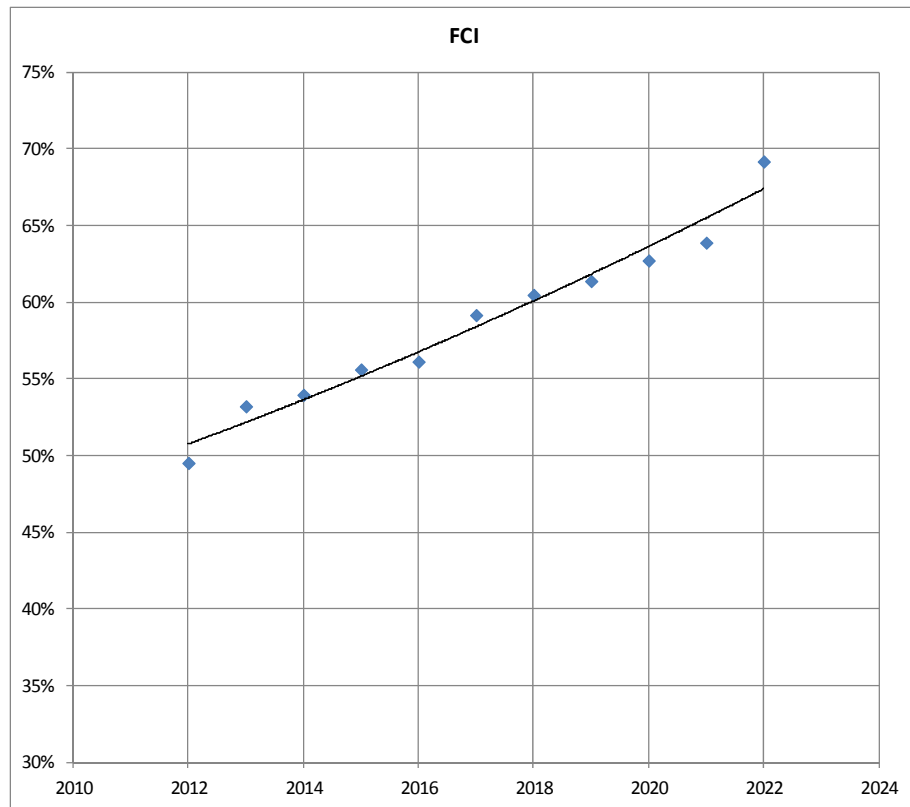

Year	Current FCI	FCI 35%	FCI 17%
2013	\$29,700,669	\$93,933,985	\$173,551,489
2014	\$32,062,222	\$98,222,538	\$180,228,567
2015	\$71,036,973	\$136,920,550	\$221,386,761
2016	\$21,973,440	\$92,162,919	\$179,163,115
2017	\$130,380,438	\$202,675,602	\$292,285,804
2018	\$56,454,755	\$128,969,312	\$221,267,820
2019	\$38,747,404	\$115,445,343	\$210,512,806

2022	\$227,379,840	\$310,035,633	\$413,918,417
Total:	\$715,213,605	\$1,445,294,033	\$2,358,019,491

Facility Condition Assessment Update for Prince George's County Public Schools

If no money is spent on the schools to renew the expiring or failing systems for the next 10 years, the FCI of the Prince George's County schools would deteriorate from the existing value of 49.52% to 69.18% as shown in the Figure 6.

Figure 6 – Increase in the FCI of Schools if No Money is Spent in Next 10 Years

Facility Description:

C. Elizabeth Rieg Center is a one-story, 45,132 square foot facility located on a 9-acre site close to I-495 (Capital Beltway) in Mitchellville, MD. The original building was constructed in 1978, with no additions constructed or major renovations performed since that time. The school has four temporary buildings on the site.

This school is part of the Special Education Inclusion Initiative. A major renovation of the school is being programmed for a 2017 construction completion that will re-purpose the facility as a Comprehensive Elementary School with a special education component.

ACCESSIBILITY ISSUES

The main entrances to the buildings comply with ADA accessibility guidelines. The main entrance has a ramp, curb cuts, wide doors for wheel chair access, and push button wall switches and automatic door openers. Wide door opening and toilet stalls include metal hand rails and are available in all of the gang restrooms. All programs in this one-story facility are handicap accessible.

A. SUBSTRUCTURE

The building typically rests on the slab-on-grade. The building does not have a basement or crawl spaces.

B. SHELL

The superstructure is load bearing masonry walls. The ceiling is framed with open web steel joist. The exterior enclosure is brick veneer over CMU and metal wall panels with glass embedded. Exterior windows are typically aluminum sash with fixed single-pane glazing. Exterior doors are hollow metal steel. All classrooms have an exterior door with panic hardware for emergency egress. The facility has low-slope built up roof with gravel ballast and metal (tin) sloping roof. The built-up roof was replaced in 1998.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors and a folding metal partition wall in the gymnasium. The interior doors, including fire doors with no fire ratings, are generally solid core wood doors with hollow metal frames. Interior fittings include chalk/tack boards, toilet accessories, handrails, and toilet partitions. The classrooms have original black boards. There is a metal ladder to access the roof through the roof hatch.

Interior wall finishes are typically painted CMU walls. Floor finishes throughout the building are typically vinyl asbestos tiles (VAT), carpet, and ceramic tiles. There is VAT floor finish in the corridors and several classrooms. There is carpet in the offices, guidance room, library, and six classrooms. There is ceramic tile floor finish in the restrooms. The overall ceiling finishes are typically suspended acoustical tiles. There is Tectum ceiling in gymnasium and paltered ceiling in the therapy tank (pool area).

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

The toilets, including flush valves, were replaced throughout the building in 2007. Domestic water distribution is copper piping and the sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by gas-fired hot water heater with a water storage tank, which was installed in 2003.

HVAC

Heating is provided by two oil-fired boilers which were installed in 2007. There is a swimming pool that has a gas-fired water heater. Cooling is supplied by an air-cooled chiller, which was installed in 2001. There are also DX package through-wall HVAC units in the administrative area. The heating/cooling distribution system is a ductwork, and 2-pipe systems using air handlers, fan coil units, fin tube radiators and unit ventilators. Fresh air is supplied by unit ventilators and air handling units. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

Facility Executive Summary

The building does not have a fire sprinkler system, except in the boiler room and a small DW system in the woodshop. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel, which was installed in 1978. Power distribution (from branch panels) wiring is typically copper. Lighting and branch wiring is typically serving recessed, surface-mounted, pendent-mounted fluorescent and some incandescent fixtures. Emergency power is provided by a stand-by generator and lighting is battery powered. Exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors, etc., and do not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are separate and include dedicated space, closets or cabinets that are inadequately secured and cooled. The building includes an internal security system that is actuated by combination devices and is not centrally monitored.

Other Electrical Systems: The building has an emergency generator with auto-transfer switch.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where four out of 45 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system.

Legislative	23A
Original Building	Built in 1969, 50,373 S.F.
School Board District	5
School Grade	Pre-K

General Information:

Function:	Special School or Center
Gross Area:	50,373 S.F.

Year Built:**Last Renovation:****Facility Description:**

Chapel Forge Early Childhood Center is a single-story, 50,373 square foot facility located on a 10.1-acre site close to MD Route 197 in Bowie, MD. The original building was constructed in 1969, with no additions constructed or major renovations performed since that time.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. Access ramp to the main entrance lacks change of color and texture and may not have recommended gradient. Main entrance hardware, interior signage, doors, and toilet accessories need to be improved to facilitate handicapped accessibility.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is hard board material with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Roofing, which was replaced in 2000, is typically low-slope with built-up roof and standing seam metal along the perimeter.

C. INTERIORS

Interior partition wall types typically include a combination of painted CMU, glazed blocks, and movable walls. Interior doors are generally solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, toilet accessories, shelving and toilet partitions. The interior wall finishes are typically ceramic tile. Floor finishes in common areas is typically ceramic tile, vinyl composition tile, carpet, and vinyl asbestos tiles. Floor finishes in assignable spaces are typically ceramic tile, vinyl tile, carpet, and vinyl asbestos tiles. During the 2008 assessment it was noted in the A.H.E.R.A. Management Plan that the school contains 27,525 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster and suspended acoustical panels. Also according to the A.H.E.R.A. Management Plan, the school contains 32,500 square feet of asbestos containing needlepoint ceiling tiles.

D. SERVICES**Conveying**

The building does not have an elevator.

Plumbing

The plumbing fixtures are original. Domestic water distribution is copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. The sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building has a partial sprinkler system.

HVAC

Heating is provided by two steam, oil fired boilers that supply ceiling mounted fan coil units, air handlers, fin tube radiators and terminal units throughout the building. Cooling is provided an air cooled chiller with condenser on the roof. Distribution is a 2-pipe system to air handlers, fan coil units, and terminal units. Fresh air is supplied mostly by infiltration. Controls are low voltage electrical thermostats and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to a main disconnect. Most of the distribution system is original. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a new diesel fired emergency generator.

Communication and Security

The system consists of audible annunciators, manual pull stations, and heat/smoke detectors. The system is inadequate, obsolete, does not comply with ADA or life safety requirements, and should be replaced. Telephone and data systems are combined, not located in a dedicated closet, and does not have an independent cooling system. The security system consists of motion sensors and is inadequate.

Facility Executive Summary

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where three out of 76 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The building has an underground fuel storage tank that was installed in 1969.

Current Repair Cost: \$9,648,524.79**Replacement Cost:** \$14,024,233.75**FCI:** 68.80%

School Board District	1
School Grade	Pre-K

General Information:

Function:	Special School or Center
Gross Area:	46,633 S.F.

Year Built:**Last Renovation:****Facility Description:**

Frances R. Fuchs Early Childhood Center is a one-story, 46,633 square foot facility located on a 12.1-acre site close to I-495 (Capital Beltway) in Beltsville, MD. The original building was constructed in 1965 and one addition was constructed in 1966, with major renovation done in 1983.

ACCESSIBILITY ISSUES

The facility is generally not in compliance with ADA requirements. The only ramp to the building is located in the rear and did not have proper safety measures in place. The entrance lacks proper hardware for the handicapped and only two toilets were observed to comply with ADA requirements during the 2008 assessment.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU and glass blocks around windows area. Exterior windows are aluminum sash with operable single-pane glazing. Exterior doors are aluminum. Roofing, which was replaced in 1998, is typically low-slope with built-up roof with standing seam metal along the eaves and over glass block walls.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, shelving, handrails and toilet partitions. The interior wall finishes are typically tile and glazed blocks. Floor finishes in common areas is typically ceramic tile, vinyl asbestos tiles, and carpet. Floor finishes in assignable spaces is typically carpet and vinyl asbestos tiles. During the 2008 assessment it was noted in the A.H.E.R.A. Management Plan that the school contains 41,000 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically plastered and suspended acoustical panels, which were installed in 2006. Ceiling finishes in assignable areas are typically plaster and suspended acoustical panels.

D. SERVICES**Conveying**

The building does not have an elevator.

Plumbing

The plumbing fixtures are original, except for the low flow toilets, which were recently installed. Domestic water distribution is copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building does not have a sprinkler system except in janitors closets and the stage area in the multipurpose room.

HVAC

Heating is provided by two dual fired steam boilers that supply ceiling mounted fan coil units, fin tube radiators and terminal units throughout the building. Cooling is provided an air cooled chiller. Distribution is a 2-pipe system to fan coil units. Fresh air is supplied mostly by infiltration. Controls are low voltage electrical thermostats and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to a main disconnect. A separate transformer provides service to the air cooled chiller. Lighting has been upgraded to electronic ballast and T-8 lamps and light levels are adequate. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a propane fired emergency generator.

Communication and Security

Facility Executive Summary

The system consists of visual/audible annunciators, manual pull stations, and heat/smoke detectors. Telephone and data systems are separate, not located in dedicated closets, and do not have independent cooling systems. The security system consists of motion sensors.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings. Kitchen/food service equipment upgrades were planned for Summer 2012.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where two out of 56 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The fuel oil tank lacks leak detection and level indication.

Current Repair Cost: \$7,893,104.75**Replacement Cost:** \$12,884,610.95**FCI:** 61.26%

School Addition 2	Built in 1983, 6,935 S.F.
School Board District	6
School Grade	PreK-5th

General Information:

Function:	Special School or Center
Gross Area:	85,882 S.F.

Year Built:**Last Renovation:****Facility Description:**

The H. Winship Wheatley Special Center is a single-story, 85,882 square foot facility located on a 17.7-acre site close to the I-95/I-495 freeways in Capitol Heights, MD. The original building was constructed in 1970, an addition was constructed in 1972, and major renovations were performed in 1983. The site has ten portable classroom buildings.

ACCESSIBILITY ISSUES

The facility seems to generally comply with ADA requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of concrete masonry with brick veneer. Exterior windows are aluminum sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically low-slope with built-up roof; the entire roof was replaced in 2011.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, lockers, shelving and toilet partitions. The interior wall finishes are typically tile and glazed blocks. Floor finishes in common areas are typically vinyl composition tile, carpet and VAT resilient tiles. Floor finishes in assignable spaces is typically ceramic tile vinyl tile, carpet and VAT resilient tiles. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster, suspended acoustical panels and exposed deck.

D. SERVICES**Conveying**

The building does not have an elevator.

Plumbing

The plumbing fixtures are original, except for the low flow toilets which were recently installed. Domestic water distribution is copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drainage system is internal with roof drains. The building has a sprinkler system.

HVAC

Heating is provided from three mechanical rooms by a combination of dual fuel boilers and roof mounted gas fired package units. Cooling is provided a scroll chiller with cooling tower, roof mounted multi-zone air handlers, roof mounted package units, and terminal units in the spaces. During the 2008 assessment, safety and code issues were noted involving the chiller in a fired equipment room. Fresh air is supplied by package units and air handlers. Controls are low voltage electrical thermostats and pneumatic. The system is not centrally monitored or controlled.

Electrical

120/208 volt electrical service enters the building at two main panels. Minor circuit additions have been installed to address air conditioning and computer circuits, but most of the system is original. Lighting has been upgraded to electronic ballasts and T-8 lamps. There are battery pack emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a propane fired emergency generator.

Communication and Security

Facility Executive Summary

The system consists of visual/audible annunciators, manual pull stations and heat/smoke detectors. Telephone and data systems are separate, not located in dedicated closets, and do not have independent cooling systems. The security system consists of motion sensors.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings. Kitchen/food service equipment upgrades were planned for Summer 2012.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where two out of 85 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school does not have a fuel oil tank; it uses natural gas and propane.

Current Repair Cost: \$13,350,213.64**Replacement Cost:** \$24,213,013.22**FCI:** 55.14%

Year Built:
Last Renovation:

Facility Description:

Howard B. Owens Science Center is a two-story, 27,400 square foot facility located on a 7.3-acre site close to MD Route 193, I-295 (Baltimore-Washington Parkway), and I-95 (Capital Beltway) in Lanham, MD. The original building was constructed in 1978 and has had no additions constructed or major renovations performed since that time, with the exception of the Science Renovation (2,984 S.F.), which was performed in 2000. The center contains classrooms, laboratories, exhibition areas, and a planetarium.

ACCESSIBILITY ISSUES

The facility is only partially in compliance with ADA requirements. The main entrance is not in compliance with ADA requirements, as the ramp to the main entrance is relatively far from the entrance and needs improvement, and the doors need hardware improvements to facilitate handicap accessibility.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. First floor construction is slab on grade and the second floor construction is metal pan with lightweight fill. Roof construction is metal pan with lightweight fill in all areas except the planetarium, which has steel roof joists. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing, which was replaced in 2006, is typically low-slope with built-up roof in most areas. The planetarium has a standing seam metal roof.

C. INTERIORS

Interior partition wall types typically include painted CMU and drywall. Interior doors are generally solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes concrete risers and treads with rubber finishes. Interior wall finishes are typically drywall and tiles and generally. Floor finishes in common areas is typically ceramic tile, vinyl composition tile, and carpet. Floor finishes in assignable spaces is typically vinyl tile and carpet. During the 2008 assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 9,850 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are plaster, suspended acoustical panels, and exposed deck.

D. SERVICES**Conveying**

The building has a hydraulic elevator.

Plumbing

The plumbing fixtures are original. Domestic water distribution is copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is a combination of roof drains, gutters, and downspouts. The building has a sprinkler system.

HVAC

Heating is provided by two gas fired boilers that supply air handlers in the mechanical room and terminal units. Cooling is provided by an air cooled chiller. Distribution is provided by a 2-pipe system connected to terminal units and air handlers. Distribution is provided by two roof top package units for the science lab classrooms. Fresh air is supplied by air handlers and roof mounted package units. Controls are low voltage electrical thermostats and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to a main disconnect. Lighting has not been upgraded but light levels are adequate. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a propane fired emergency generator.

Communication and Security

Facility Executive Summary

The system consists of audible annunciators, manual pull stations, and heat/smoke detectors. Renovation of the lab classrooms included addition of strobes. Telephone and data systems are separate, not located in dedicated closets, and do not have independent cooling systems. The security system consists of motion sensors.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where two out of 26 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school does not have a fuel oil tank; it uses natural gas.

Report Date: 08 Sep 2012

Facility: \Special Schools and Centers\James Duckworth Regional

Address: 11201 Evans Trail, Beltsville, MD 20705

Attributes:

School Area	1
Congressional	5
County Council	1
Historical Building	No
Legislative	21
Original Building	Built in 1978, 41,480 S.F.
School Board District	1
School Grade	K-12th

General Information:

Function:	Special School or Center
Gross Area:	41,480 S.F.

Year Built:
Last Renovation:

Facility Description:

James Duckworth Special Center is a one-story, 41,480 square foot facility located on a 10-acre site close to I-95 in Beltsville, MD. The original building was constructed in 1978, with no additions constructed or major renovations performed since that time.

This school is part of the Special Education Inclusion Initiative. A major renovation of the school is being programmed for a 2016 construction completion that will re-purpose the facility as a Comprehensive Elementary School with a special education component.

ACCESSIBILITY ISSUES

The facility is generally in compliance with ADA requirements. The bus loading area is covered and automobile-pedestrian traffic is separated well. The main entrance has a ramp leading to it and the main entrance doors have a push button mechanism to open them for the handicapped. Corridors and swimming pool appear to have adequate accessibility for the handicapped as well.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill. The swimming pool has a slab on grade concrete roof. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with operable single-pane glazing. Exterior doors are a combination to hollow metal steel, solid core wood and FRP (Fiberglass Reinforced Plastic). Roofing was replaced in 2007, is typically low-slope with built-up roof.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. The interior wall finishes are typically tiles and glazed blocks. Floor finishes in common areas are typically ceramic tile and vinyl composition tile. Floor finishes in assignable spaces are typically vinyl tile and ceramic tiles. Ceiling finishes in common areas are typically plaster and suspended acoustical panels that are in fair condition. Ceiling finishes in assignable areas are typically plaster, suspended acoustical panels, and exposed deck. During the 2008 assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 4,800 square feet of Tectum acoustical panels.

D. Services

Conveying

The building does not have an elevator, but does have a handicap lift for the swimming pool.

Plumbing

The plumbing fixtures are original, except for the low flow toilets, which were recently installed. Domestic water distribution is copper piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drainage system is internal with roof drains. The building does not have a sprinkler system.

HVAC

Heating is provided by two dual fired steam boilers that supply above-ceiling air handlers, fin tube radiators, and terminal units throughout the building. Cooling is provided by an air cooled scroll chiller, which was installed in 2004. Distribution is by a 2-pipe system and metal duct work from the air handlers to the spaces. Fresh air is supplied mostly by infiltration. Controls are low voltage electrical thermostats and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to a main disconnect. Most of the distribution system is original. Most of the lighting has not been upgraded. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a propane powered emergency generator.

Communication and Security

Facility Executive Summary

The system consists of audible visual/annunciators, manual pull stations, and heat/smoke detectors. Telephone and data systems are separate, not located in dedicated closets, and do not have independent cooling systems. The security system consists of motion sensors.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where two out of 43 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school does not have a fuel oil tank; it uses natural gas.

Facility Executive Summary

Facility: \Special Schools and Centers\Margaret Brent Regional
Address: 5816 Lamont Terrace, New Carrollton, MD 20784

Attributes:

School Area	1
Congressional	5
County Council	3
Historical Building	No
Legislative	22
Original Building	Built in 1962, 38,933 S.F.
School Addition 1	Built in 1970, 3,268 S.F.
School Addition 2	Built in 1983, 6,035 S.F.
School Board District	2
School Grade	K-12th

General Information:

Function:	Special School or Center	Year Built:
Gross Area:	48,236 S.F.	Last Renovation:

Facility Description:

Margaret Brent School is a one-story, 48,236 square foot facility located on an 11-acre site close to I-495 (Capital Beltway) in New Carrollton, MD. The original building was constructed in 1962 and additions were constructed in 1970 and 1983, with major renovation done in 1983. In addition, FY03 FSRP - Fire Alarm and FY03 SR Roof Replacement were performed in 2004. The school has two temporary buildings on the site.

This school is part of the Special Education Inclusion Initiative. A major renovation of the school is being programmed for a 2018 construction completion that will re-purpose the facility as a Comprehensive Elementary School with a special education component.

ACCESSIBILITY ISSUES

The main entrance has curb cuts; doors are wide enough for wheel chair access, and push button wall switches and automatic door openers. Handicap toilet stalls are available in the gang restrooms and in the restrooms attached to the classrooms. All the programs in the facility are handicap accessible.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls. The building does not have a basement, but does have a crawl space.

B. SHELL

The superstructure concrete frame load bearing masonry walls and open web steel joist roof framing. The roof structure is steel joists. The exterior enclosure is comprised of brick veneer over CMU, single pane metal windows with operable frames, and hollow metal steel doors. Several classrooms have a fire window exits. All classrooms have exterior doors. The original building has low-slope, built up roof with gravel ballast. The built-up roof was replaced in 2004

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors. Interior doors, including fire doors, are generally solid core wood doors with hollow metal frames. Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. The classrooms have original chalkboards and a few have new electronic white boards. The facility does not have stair construction. There is a metal ladder to access the roof through the roof hatch.

The interior wall finishes are typically painted CMU. The floor finishes throughout the building are typically vinyl composition tiles (VCT), vinyl asbestos tiles, or vinyl asbestos tiles (VAT), carpet, and ceramic tiles. There is VCT floor finishes in the classrooms. There is carpet in the main office. There are ceramic tiles in the restrooms and kitchen. During the 2008 assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 31,650 square feet of vinyl asbestos tiles, and 54 square feet of asbestos containing vinyl sheet flooring. The overall ceiling finishes are typically suspended acoustical tiles in the corridor and acoustical tiles in the classrooms.

D. SERVICES

Conveying

The building does not include conveying equipment, with exception of a chair lift in the swimming pool (therapeutic tank).

Plumbing

The plumbing fixtures are original. Domestic water distribution is copper piping and the sanitary waste system is cast iron. Rain water system is external with roof gutters and leaders, installed in 2004.

HVAC

Facility Executive Summary

Heating is provided by three gas-fired steam boilers - two in the boiler room and one in the penthouse feeding the pool area. Control of the system is through Prince George's County main office. Cooling is supplied by a water cooled chillers. The heating/cooling distribution system is a combination of ductwork in office, and unit ventilators and VAV boxes in classrooms. Fresh air is supplied by infiltration. Ceiling and wall-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building has a minimal fire sprinkler system only feeding storage areas. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution from branch panels wiring is typically copper and the system trips. Lighting and branch wiring is typically serving recessed fluorescents fixtures. Emergency power and lighting are present and exit signs are present at exit doors and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in most of the building, which were installed in 2004, and appears to comply with ADA requirements. The system is activated by pull stations and smoke detectors and is centrally monitored. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by contact devices and is centrally monitored; however, there are no surveillance cameras.

Other Electrical Systems: The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings. Kitchen/food service equipment upgrades were planned for Summer 2012.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where four out of 35 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has a fuel storage tank that was replaced in 2008.

eCOMET Facility Report

Report Date: 10 Sep 2012

Facility Executive Summary

G2030	Pedestrian Paving	System	Beyond Useful Life	Renew System	1	Ea.	\$21,790	\$11,353	\$33,143	Necess ary- 2-5 Yrs	Deferred Maintena nce	Concrete sidewalks immediately adjacent to the facility are beyond useful life and in poor condition, with cracks and damaged edges.
D2010	Plumbing Fixtures	System	Beyond Useful Life	Renew System	1	Ea.	\$356,464	\$185,718	\$542,182	Necess ary- 2-5 Yrs	Deferred Maintena nce	Plumbing fixtures are mostly original and need update. Some toilets and urinals were updated while most sinks, faucets, drinking fountains and other plumbing fixtures were not updated. Some were covered with plastic bags to prevent students from using them. Some sinks are chipped, cracked, and have rust. Some faucets are slow and broken.
D2020	Domestic Water Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$25,083	\$13,068	\$38,151	Necess ary- 2-5 Yrs	Deferred Maintena nce	Domestic water distribution is original and is beyond useful life.
D2040	Rain Water Drainage	System	Beyond Useful Life	Renew System	1	Ea.	\$27,495	\$14,325	\$41,819	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D2030	Sanitary Waste	System	Beyond Useful Life	Renew System	1	Ea.	\$39,071	\$20,356	\$59,427	Necess ary- 2-5 Yrs	Deferred Maintena nce	The sanitary piping is beyond useful life, outdated, and in some areas are clogged or leaking.
D3050	Terminal & Package Units	System	Beyond Useful Life	Renew System	1	Ea.	\$1,151,393	\$599,876	\$1,751,269	Necess ary- 2-5 Yrs	Deferred Maintena nce	Most of the terminal units are original and show signs of damage. The school is in need of complete terminal units update.
D3020	Heat Generating Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$251,792	\$131,184	\$382,976	Necess ary- 2-5 Yrs	Deferred Maintena nce	The heat generation system is original and is beyond useful life. The boilers are in poor condition. The school engineer indicated that these boilers are in constant break and repair.
D3030	Cooling Generating Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$204,521	\$106,555	\$311,076	Necess ary- 2-5 Yrs	Deferred Maintena nce	Most of the cooling generation is original with control issues and needs to be updated.
D3040	Distribution Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$466,924	\$243,268	\$710,192	Necess ary- 2-5 Yrs	Deferred Maintena nce	The distribution system pipes, pumps, ductwork, vents and units are mostly outdated and beyond useful life. Circulation pumps are leaking, pipe insulation is peeling off, and pipes are leaking. There are some of leaks and stains throughout the school.
D3060	Controls & Instrumentation	System	Beyond Useful Life	Renew System	1	Ea.	\$42,930	\$22,367	\$65,297	Necess ary- 2-5 Yrs	Deferred Maintena nce	The control system is limited to heating units and is original and needs to be updated.
D3070	Systems Testing & Balancing	System	Beyond Useful Life	Renew System	1	Ea.	\$33,765	\$17,592	\$51,357	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D5010	Electrical Service/Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$77,660	\$40,461	\$118,121	Necess ary- 2-5 Yrs	Deferred Maintena nce	The main power switchgear and most of the electrical panels in hallways and classrooms are original and need to be updated. Some panels have no capacity to expand at the time of need.

General Information:

Function: Special School or Center
Gross Area: 42,148 S.F.

Year Built:
Last Renovation:

Facility Description:

Tanglewood Regional Center is a one-story, 42,148 square foot facility located on a 10-acre site close to MD Route 5 in Clinton, MD. The original building was constructed in 1957 and additions were constructed in 1964 (four classrooms) and 1983 (swimming pool), with major renovation performed in 1983.

ACCESSIBILITY ISSUES

The main entrance has a ramp and is wide enough for wheel chair access and push button wall switches and automatic door openers. Handicap toilet stalls are available in the gang restrooms for both men and women. Toilet configurations and accessories are adequate.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, or sub-floor.

B. SHELL

The superstructure is load bearing masonry walls with slab-on-grade floor and open web steel joist roof framing. The exterior enclosure is comprised mainly of brick veneer over CMU, partial vinyl siding, single panel metal windows (some with operable frames), and hollow core metal steel doors. The exterior enclosure is brick veneer. Each classroom has a fire exit window. The roof construction is low-slope, built-up roof with stone ballast and flashing. The entire roof was replaced in 2009.

C. INTERIORS

The interior partition walls typically include painted CMU with glazed block wainscot in the corridors and drywall. Interior doors are generally solid core wood doors with hollow metal frames. The Interior fittings include chalk/tack boards, lockers, toilet accessories, handrails, and toilet partitions. The school has a concrete stair with steel frame to access the mechanical room close to the pool. The school also has small metal stair in the boiler room and concrete stair in the stage area because of difference in the floor level.

Interior wall finishes are typically painted CMU and drywall. Floor finishes are typically vinyl composition tiles in classrooms, multi-purpose room, and kitchen, terrazzo in hallways and carpet in three classrooms. The carpet in most of the classrooms has been replaced with vinyl tiles within the last few years. There is ceramic tile in the pool and shower areas. There is terrazzo flooring in the hallways. During the 2008 assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 960 square feet of vinyl asbestos tiles. The ceiling finishes are typically suspended acoustical panels. The kitchen has drywall ceilings.

D. SERVICES

Conveying

The building does not include an elevator.

Plumbing

The plumbing fixtures are original to the building. Domestic water distribution is copper piping, and the sanitary waste system is cast iron. Rain water system is internal and external with roof drains. The building has a sprinkler system.

HVAC

Heating is provided by two gas-fired boilers supplying the main building and one gas-fired boiler supplying the pool area, installed in 1987. Cooling is supplied by water cooled chillers, installed in 1992. The heating/cooling distribution system is a mixture of fin tube radiators and unit ventilators and is in poor condition. Ceiling-mounted exhaust fans are installed in restrooms and ventilation is adequate, October 2006. Controls and instrumentation are pneumatic and are original and not centrally controlled by an energy management system.

Fire Protection

The building has a fire sprinkler system that supplies less than 10% of the building. Fire extinguishers are distributed near fire exits and corridors.

Electrical

Facility Executive Summary

The electrical service is fed from a pole mounted transformer that delivers power to a main panel. Power distribution from branch panels wiring is typically copper. Lighting and branch wiring is typically serving recessed, surface-mounted fluorescent and incandescent. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in interior corridors and appears to comply with ADA requirements. The system is activated by pull stations and smoke detectors and is centrally monitored. The telephone and data systems are combined and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by contact devices and is centrally monitored.

Other Electrical Systems: The building has an emergency generator

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where two out of 45 are handicap spaces with strip paths to building entrance. The parking lot was repaved in 2012. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school does not have a fuel oil tank; it uses natural gas.

Current Repair Cost: \$5,186,807.60**Replacement Cost:** \$12,621,823.49**FCI:** 41.09%

Facility: \Special Schools and Centers\William Schmidt Center

Address: 18501 Aquasco Road, Brandywine, MD 20613

Attributes:

School Area	2
Congressional	5
County Council	9
Historical Building	No
Legislative	27A
Original Building	Built in 1956, 14,722 S.F.
School Addition 1	Built in 1959, 2,611 S.F.
School Addition 2	Built in 1975, 2,912 S.F.
School Addition 3	Built in 1982, 17,851 S.F.
School Board District	9
School Grade	K-12th

General Information:

Function:	Special School or Center	Year Built:
Gross Area:	38,146 S.F.	Last Renovation:

Facility Description:

William S. Schmidt Center is a one-story, 38,146 square foot facility located on a 449.6-acre site close to US Route 301 in Brandywine, MD. This outdoor educational center consists of one administrative building and three sites (i.e., Site 1, Site 2, and Site 3). Site 1 includes three village buildings, a camp center, and two new temporary buildings. Site 2 includes a school building formerly Orme Elementary School. Site 3 includes a service building, six old temporary buildings. The Lodge, Field Station and the remaining four are named boy cabins and girl cabins. The Orme Elementary School building was originally built in 1956, with an addition of two rooms constructed in 1959. In 1975, a service building was constructed and in 1982, an administrative building, three villages, and the camp center were constructed. Six temporary buildings were originally placed at Site 3 in 1972 and were removed and replaced in 1995. Three temporary buildings were placed at the site (site 1 and site 3) in 2006.

ASSESSIBILITY ISSUES

The main entrance door to the Orme Elementary School building has a ramp and is wide enough for wheel chair access, but the entrance lacks push button wall switches and automatic door openers. Handrails are available.

A. SUBSTRUCTURE

The facility buildings, including the Orme Elementary School building, three villages, camp center, and service center building, typically rest on slab-on-grade foundations. The facility buildings do not have a basement, sub-floor, or crawl space, with exception of a small cellar in the boiler room in Orme Elementary School building, which holds a water tank.

B. SHELL

The superstructure is load bearing masonry walls with slab-on-grade floor and open web steel joist roof framing. The exterior enclosure is comprised of exposed CMU. The exterior enclosure of Orme Elementary School building has both brick veneer over CMU and exposed CMU bricks. The service building, camp center, and three villages have both exposed CMU and T1-11 plywood sheathing as exterior siding. The exterior enclosure also includes single panel metal windows with operable frames and hollow metal steel doors. The metal windows in the Orme Elementary School building, administrative building, villages, and camp center buildings are old. The service building does not have windows. There are metal windows in three new temporary buildings.

There are hollow metal steel doors in the Orme Elementary School building, administrative building, villages, camp center, and service center. There are exterior wood doors on the four temporary buildings (cabins). There are hollow metal steel doors in two old temporary buildings. There are hollow metal steel doors in the three new temporary buildings.

The roof construction is both low-slope built-up roof with stone ballast and asphalt shingle roof. The built-up roof on the Orme Elementary School building was replaced in 1997. The asphalt shingle roof on the administrative building was replaced in 2000. The asphalt shingle roofs on the villages, camp center, and service buildings were replaced in 2006. The asphalt shingle roof on the six old temporary buildings was replaced in 2007.

C. INTERIORS

Interior partition walls typically include painted CMU in the Orme Elementary School building, service building, and camp center, with glazed block wainscot in the corridors. The partition walls in administrative building and villages are typically painted CMU and drywalls, which divide offices and sleeping quarters. Interior doors are generally solid core wood doors or hollow core metal doors with hollow metal frames. The solid core wood doors metal frames are rusting in the Orme Elementary School building. There are hollow core metal doors in the administrative building, villages, camp center, and service building. Interior fittings in the building include chalk/tack boards (in camp center and village), toilet accessories, handrails, and toilet partitions. The facility does not have second floor and the only ladder present is in the boiler room that provides access to the cellar that holds water tank.

Interior wall finishes are typically painted CMU and drywall. The four old temporary buildings (cabins) have T1-11 plywood sheathing, which does not require painting. The two old temporary buildings, Lodge and the Field Station all have painted drywall. The new temporary buildings have painted drywall.

Facility Executive Summary

Floor finishes are typically carpet, terrazzo, vinyl asbestos tiles, and ceramic tiles in toilets and showers. The administrative building has carpet in offices and conference rooms and concrete in the remainder of the building. The Orme Elementary School building has terrazzo flooring in corridors and cafeteria and vinyl asbestos tiles in sleeping rooms and kitchen. There are concrete floors in camp center. The villages have concrete floors in the lobby, vinyl composition tiles in the sleeping quarters, and ceramic tiles in the toilets and showers. The four old temporary buildings (cabins) have carpet and plywood floors. The remaining two old temporary building and three new temporary buildings have vinyl composition tile floor finish. During the 2008 Assessment it was noted in the A.H.E.R.A. Management Plan, the school contains 18,720 square feet of vinyl asbestos tiles.

The overall ceiling finishes are typically suspended acoustical panels and drywall. The acoustic tiles in the Orme Elementary School building are old. There is painted drywall ceilings in the administrative building, villages, camp center, and service center. The four old temporary buildings (cabins) have T1-11 plywood sheathing that holds insulation and does not require finish. The remaining two old temporary buildings and three new temporary buildings have drop ceilings.

D. SERVICES**Conveying**

The building does not have an elevator.

Plumbing

The plumbing fixtures are original and need updating. Domestic water distribution is copper piping and sanitary waste system is cast iron. The rain water systems are cast iron and aluminum.

HVAC

There is a propane-fired boiler and unit ventilators which provide heating for the building. Cooling is provided by temporary window units. Ceiling-mounted exhaust fans are installed in restrooms and ventilation is inadequate. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The buildings do not have a fire sprinkler system, except for the boiler room. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pole-mounted transformer that delivers power to a main panel. Power distribution from branch panel wiring is typically copper. Lighting and branch wiring is typically serving surface-mounted fluorescents fixtures. Emergency power and lighting are not present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible with strobe annunciators in corridors and appears to comply with ADA requirements. The system is activated by pull stations and smoke/heat detectors, and appears to be in fair condition. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by contact devices.

Other Electrical Systems: The building does not have a generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where two out of 19 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has a fuel oil storage tank installed in 1995.

Current Repair Cost: \$6,549,073.87**Replacement Cost:** \$10,081,270.41**FCI:** 64.96%

Legislative	25
Original Building	Built in 1964, 29,536 S.F.
School Addition 1	Built in 1965, 11,899 S.F.
School Addition 2	Built in 1986, 2,880 S.F. (Relocatables)
School Board District	7
School Grade	NA

General Information:

Function:	Other	Year Built:
Gross Area:	44,315 S.F.	Last Renovation:

Facility Description:

Berkshire Elementary School is a two-story, 44,315 square foot facility located on a 10-acre site close to I-495 (Capital Beltway) in District Heights, MD. The original building was constructed in 1964, with additions constructed in 1965 and 1986 (Four Modulares) and no major renovations, with exception of FY03 FSRP - Fire Alarm, which was performed in 2004.

ACCESSIBILITY ISSUES

The school has no elevator or ramp to the second floor and the programs on the second floor are not handicap accessible. Handicap toilet stalls are available in the gang restrooms on the first floor only. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, or sub-floor. The building has a crawl space.

B. SHELL

The superstructure of the facility is load bearing masonry walls with slab-on-grade floor and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over concrete masonry unit (CMU), single pane metal windows with operable frames, and hollow metal steel doors. The original building has low-slope built up roof with gravel ballast that was replaced in 1994. The 1986 addition has a single ply rubber membrane roof.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk/tack boards, toilet accessories, handrails, and toilet partitions. The stairs have steel treads and risers with steel frames. There is a metal ladder to access the roof hatch.

Interior wall finishes are typically painted CMU. Floor finishes throughout the building are typically 9x9 vinyl asbestos tiles (VAT), 12x12 vinyl composition tiles (VCT), carpet, and ceramic tiles. The ceiling finishes are typically suspended 2x2 or 2x4 acoustical tiles.

D. SERVICES

Conveying

The building does not include conveying equipment.

Plumbing

Fixtures are original. The toilets were updated 100% in 2007. Domestic water distribution is primarily copper. Sanitary waste system is cast iron. Rain water system is external with roof drains and scuppers. Domestic hot water is provided by gas hot water heater.

HVAC

Heating is provided by oil/gas-fired boilers. Cooling is supplied by window units in selected areas. The heating/cooling distribution system is typically unit ventilators and fin-tube radiators. Fresh air is supplied by infiltration and window units. Ceiling-mounted exhaust fans are installed in restrooms and kitchen. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building does not have fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pole mounted transformer. Power distribution wiring is typically copper 3-wire grounded. Lighting and branch wiring is 3-wire grounded serving recessed and pendent-mounted fluorescent. Exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

Facility Executive Summary

The fire alarm system consists of a main panel in the boiler room and audible and strobe annunciators in common spaces and interior corridors. The system is activated by pull stations and aural bell/horn alert devices and two heat sensors in storage areas. The telephone and data systems are separate. The building includes an internal security system that is actuated by contact devices and is centrally monitored.

Other Electrical Systems: The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, medical equipment, and food service equipment. The building also includes fixed casework/cabinetry in the classrooms, window treatment, and multiple seating furnishings (folding chairs and tables) in multipurpose room. The grease trap is serviced by building personnel.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Asphalt surface parking is available on-site. There are two reserved handicap spaces out of total 35 parking spaces. The bus drop-off zone at the front entrance is covered. Drainage is handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic.

Current Repair Cost: \$8,038,181.47**Replacement Cost:** \$11,430,406.61**FCI:** 70.32%

Facility Executive Summary

Report Date: 08 Sep 2012

Facility: \Other\Berkshire Elementary_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems B2020		Exterior Windows (Original Bldg.)	System	Beyond Useful Life	Renew System	1	Ea.	\$5,284,800 \$121,405	\$2,753,381 \$63,252	\$8,038,181 \$184,656	Necess ary- 2-5 Yrs	Deferred Maintena nce	The metal windows throughout the building are original and beyond useful life. Water leaks were reported through windows throughout the building, especially when gutters are clogged with leaves. The flashing and caulking around the windows are in fair to poor condition and are beyond useful life. The single pane windows are not energy efficient.
	B2030	Exterior Doors (Original Bldg.)	System	Beyond Useful Life	Renew System	1	Ea.	\$77,483	\$40,369	\$117,852	Necess ary- 2-5 Yrs	Deferred Maintena nce	The exterior doors throughout the building are original, beyond useful life, and in poor condition (difficult to operate). Some metal exterior doors do not close properly. The door hardware is beyond useful life and in fair condition.
	C1020	Interior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$84,199	\$43,867	\$128,066	Necess ary- 2-5 Yrs	Deferred Maintena nce	Interior doors are in fair to poor operating condition, with scratched surfaces and chipped corners. The interior doors (including fire doors) are beyond useful life and need refinishing. The door hardware is in fair condition.
	C1030	Fittings	System	Beyond Useful Life	Renew System	1	Ea.	\$122,753	\$63,954	\$186,707	Necess ary- 2-5 Yrs	Deferred Maintena nce	Interior fittings in the building include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. The classrooms have original chalkboards which are old, beyond useful life, and in fair condition. Other toilet accessories such as metal partitions are original, rusted/stained, and in poor condition. All old toilet accessories are beyond useful life and need to be replaced. The mirrors in the restrooms are in fair condition and need an upgrade.
	C3010230	Paint	System	Beyond Useful Life	Renew System	1	Ea.	\$178,146	\$92,814	\$270,961	Necess ary- 2-5 Yrs	Deferred Maintena nce	Some portion of the facility has not been painted for more than five years and the paint is in poor condition (stained and peeling off the walls).
	C3020410	Carpet	System	Beyond Useful Life	Renew System	1	Ea.	\$23,850	\$12,426	\$36,276	Necess ary- 2-5 Yrs	Deferred Maintena nce	The carpet in some classrooms and principal's office is in poor condition and probably has asbestos tiles underneath it.

Original Building	Built in 1960, 35,529 S.F.
School Addition 1	Built in 1964, 8,554 S.F.
School Board District	6
School Grade	NA

General Information:

Function:	Other
Gross Area:	44,083 S.F.

Year Built:
Last Renovation:**Facility Description:**

Bonnie Johns Media Center is a two-story, 44,083 square foot facility located on a 10-acre site close to MD Route 295 (Baltimore-Washington Parkway), MD Route 202, and US Route 50 in Landover, MD. The original building was constructed in 1960 and an addition was added in 1964, with no major renovation, except for FY06 CFC Code - Chiller and roof replacement in 2007.

ACCESSIBILITY ISSUES

Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade and concrete footings. The building does not have a basement.

B. SHELL

The superstructure is load bearing CMU walls and open web steel joist for roof framing. Floor construction is slab on grade. Roof construction is flat slab. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with inoperable single-pane glazing. Exterior doors are hollow metal steel with hollow metal frames. Roofing is typically a low slope built-up roof that was replaced in 2007.

C. INTERIORS

Interior partition wall types typically include painted CMU and glazed block. Interior doors are generally solid core with hollow metal frames. Interior fittings include chalkboards, tack boards, graphics, lockers, toilet accessories, shelving, handrails, and toilet partitions. Stair construction includes concrete risers and treads with tile finish. The interior wall finishes are typically painted CMU and glazed block. Floor finishes in common areas is typically, ceramic tile, vinyl asbestos tile, and carpet. Floor finishes in assignable spaces is typically vinyl asbestos tile and carpet. Ceiling finishes in common areas are typically 2x4 suspended acoustical panels and 2x4 Tectum.

D. SERVICES**Conveying**

The building does not have an elevator or chair lift.

Plumbing

Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by a gas hot water heater.

HVAC

Heating is provided by two gas fired boilers. Cooling is supplied by an air-cooled chiller, split systems, roof top units, and window units. The heating/cooling distribution system is ductwork, 2-pipe, and air handlers. Fresh air is supplied by infiltration and air handlers. Ceiling exhaust fans are in restrooms. Controls and instrumentation are digital for cooling and pneumatic for heating and are not centrally controlled by an energy management system.

Fire Protection

The building has a dry fire suppression system in the server room only. Most of the school does not have fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer. Power distribution wiring is typically copper. Lighting and branch wiring is 3-wire grounded serving recessed, surface-mounted, and pendent-mounted fluorescent and incandescent. Emergency power and emergency lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible and strobes and audible annunciators. The system is activated by pull stations and heat sensors and is partially centrally monitored, the server room. The telephone and data systems are combined. The building includes an internal security system that is actuated by optical and contact devices and is centrally monitored.

Other Electrical Systems: The building has a 150 KW emergency generator.

E. EQUIPMENT & FURNISHINGS

Facility Executive Summary

The building includes fixed library and audio-visual equipment. The building also includes fixed casework, window treatment, and floor grilles and mats. The facility does not contain food service equipment.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Surface parking is available on-site with two out of 99 spaces are handicap spaces. Landscaping is not irrigated. Drainage is handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school has a 8,000 gallon fuel oil tank of dual wall construction with level and leak detection systems that was installed in 2002.

Current Repair Cost: \$8,077,908.24**Replacement Cost:** \$11,508,656.48**FCI:** 70.19%

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems D3050	Terminal & Package Units	System		Beyond Useful Life	Renew System	1	Ea.	\$5,310,919	\$2,766,989	\$8,077,908	Necess ary- 2-5 Yrs	Deferred Maintena nce	Most of the terminal units are original and show signs of damage. The school is in need of complete terminal units update. The school engineer stated the units' control system is not operating at times and, if operating, the temperature is not adequate.
								\$1,028,016	\$535,596	\$1,563,612			
D3020	Heat Generating Systems	System		Beyond Useful Life	Renew System	1	Ea.	\$240,252	\$125,171	\$365,424	Necess ary- 2-5 Yrs	Deferred Maintena nce	The boilers are old and beyond useful life and need repairs or replacement.
D3030	Cooling Generating Systems	System		Beyond Useful Life	Renew System	1	Ea.	\$241,134	\$125,631	\$366,765	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D3040	Distribution Systems	System		Beyond Useful Life	Renew System	1	Ea.	\$445,679	\$232,199	\$677,878	Necess ary- 2-5 Yrs	Deferred Maintena nce	The distribution system pipes, pumps, ductwork, vents and units are mostly outdated and beyond useful life. Circulation pumps are leaking, pipe insulation is peeling, and pipes are leaking. There are a lot of leaks and stains throughout the school.
D3060	Controls & Instrumentation	System		Beyond Useful Life	Renew System	1	Ea.	\$40,556	\$21,130	\$61,686	Necess ary- 2-5 Yrs	Deferred Maintena nce	The control system for each of the roof top units is located in one area and is not centralized. This limits the control for a number of rooms and keeps the others without controls. Also, control for heating is outdated and mostly inoperable.
D3070	Systems Testing & Balancing	System		Beyond Useful Life	Renew System	1	Ea.	\$32,181	\$16,766	\$48,947	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D4010	Sprinklers	System		Beyond Useful Life	Renew System	1	Ea.	\$167,075	\$87,046	\$254,120	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D5010	Electrical Service/Distribution	System		Beyond Useful Life	Renew System	1	Ea.	\$73,619	\$38,355	\$111,974	Necess ary- 2-5 Yrs	Deferred Maintena nce	The main power switchgear and most of the electrical panels in the hallways and classrooms are original and need update. Some panels have no capacity to expand. The electrical room is full of boxes, flammable materials, and other materials that could be a fire and safety hazard.

General Information:

Function:	Other
Gross Area:	111,983 S.F.

Year Built:

Last Renovation:

Facility Description:

Croom Vocational High School is located on a 27.6-acre site close to the U.S. Route 301 in Upper Marlboro, Maryland. The facility consists of two sites (Site 1 and Site 2). Site 1 is located at Mt. Calvert Road and includes four concrete buildings and three temporary buildings. Site 2 is located at Duvall Road and includes three concrete buildings and eight temporary buildings. The four concrete buildings at Site 1 are also called Building 5, Student Center, Building 7, Cafeteria, Building 8, and Building 3, In-school Suspension. The three concrete buildings at Site 2 are called Building 1, Main Office, Building 3, Technology Storage, and Building 8, Electrical Workshop. The facility was originally built in 1950 with a total area of 33,695 square feet out of which 20,968 square feet belongs to Site 1 and 12,727 square feet belongs to Site 2. The school has five temporary buildings installed in 2007, three of them were put on the Site 1 and remaining two on Site 2.

ACCESSIBILITY ISSUES

Further study by an ADA Specialist is required to insure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The buildings (four concrete buildings at Site 1 and three concrete buildings at Site 2) typically rest on slab-on-grade. The buildings do not have a basement, sub-floor, or crawl space.

B. SHELL

The superstructure of the buildings is load masonry walls with slab-on-grade floor and open web steel joist roof framing. The exterior enclosure is comprised of both exposed concrete masonry unit (CMU) and brick veneer over CMU. The exterior enclosure of the buildings also includes single pane metal windows with operable frames, hollow metal steel doors, and solid core wood doors. The exterior doors at Site 2 were replaced in 1999. Roof construction is both low-slope built-up roof with stone ballast on concrete buildings and single ply rubber membrane on the temporary buildings.

C. INTERIORS

The interior partitions typically include painted CMU walls at both Site 1 and Site 2. Interior doors are generally hollow core wood doors with wood frames. The interior doors at Site 2 were replaced in 1999. Interior fittings include chalk/tack boards, toilet accessories, handrails, and toilet partitions. Toilet accessories at Site 2 were replaced in 1999. The facility does not have stair construction. The ladder to access the roof is on the exterior of the building.

Interior wall finishes are typically painted CMU. The floor finishes are typically carpet, 9x9 vinyl asbestos tiles (VAT), 12x12 vinyl composition tiles (VCT), and ceramic tiles (in showers). The carpet in the classrooms at Site 2 was replaced in 1999. The VCT floor finishes in the buildings at Site 2 were also replaced in 1999. The overall ceiling finishes are typically wood panels.

D. SERVICES

Conveying

The building does not have conveying equipment.

Plumbing

Fixtures may be original. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal with roof drains.

HVAC

Heating is provided by four oil-fired boilers. Cooling is supplied by window units. The heating distribution system is a 2-pipe system using radiant piping. Fresh air is supplied by windows. Ceiling / wall-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Facility Executive Summary

Electrical

The electrical service is fed from pad mounted and pole mounted transformers. Power distribution from branch panel wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded serving surface-mounted fluorescents. Emergency power is not present, but lighting is present and exit signs are present at exit doors and near stairways.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in corridors. The system is activated by pull stations and one smoke detector in boiler room 1 and is centrally monitored. The telephone and data systems are separate. The building includes an internal security system that is actuated by contact devices and is centrally monitored.

Other Electrical Systems: The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes audio-visual, laboratory, library, medical equipment, and kitchen equipment. The building also includes fixed casework/cabinetry, window treatment, and multiple seating furnishings (in staff development room or conference room for 30 to 40 people).

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Asphalt surface parking is available on-site at both Site 1 and Site 2. There are six handicap spaces out of total 44 parking spaces. Drainage is handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting at both sites for vehicular and pedestrian night traffic.

Current Repair Cost: \$6,779,701.51**Replacement Cost:** \$8,502,355.65**FCI:** 79.74%

Facility Executive Summary

Report Date: 08 Sep 2012

Facility: \Other\Croom Vocational High_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems	B2020	Exterior Windows	System	Beyond Useful Life	Renew System	1	Ea.	\$4,457,397 \$100,074	\$2,322,304 \$52,139	\$6,779,702 \$152,213	Necess ary- 2-5 Yrs	Deferred Maintena nce	The metal windows at both sites are old, difficult to operate, and in poor condition. The flashing and caulking around the windows are also damaged at some places.
	B2030	Exterior Doors (Site-1)	System	Beyond Useful Life	Renew System	1	Ea.	\$39,839	\$20,756	\$60,595	Necess ary- 2-5 Yrs	Deferred Maintena nce	The steel doors and wood doors in buildings at Site 1 are old, beyond useful life, do not close properly, and in fair to poor condition. The door hardware is also beyond its useful life and in fair to poor condition. The exterior doors at Site 2 were replaced in 1999 and are in good condition.
	B3020	Roof Openings	System	Beyond Useful Life	Renew System	1	Ea.	\$6,065	\$3,160	\$9,225	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	C3010230	Paint	System	Beyond Useful Life	Renew System	1	Ea.	\$133,396	\$69,499	\$202,895	Necess ary- 2-5 Yrs	Deferred Maintena nce	Interior wall finishes are typically painted CMU walls. The facility has not been painted in last five years.
	C3010230	Tile	System	Beyond Useful Life	Renew System	1	Ea.	\$9,630	\$5,017	\$14,647	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	C3020410	Carpet	System	Beyond Useful Life	Renew System	1	Ea.	\$14,490	\$7,549	\$22,039	Necess ary- 2-5 Yrs	Deferred Maintena nce	The carpet floor finishes in buildings at Site 1 are old, beyond useful life, and in poor condition. The carpet in the classrooms at Site 2 were replaced in 1999 and is in fair to poor condition.
	C3020410	Ceramic Tile	System	Beyond Useful Life	Renew System	1	Ea.	\$37,110	\$19,334	\$56,444	Necess ary- 2-5 Yrs	Deferred Maintena nce	The ceramic tiles in the shower and restrooms are stained and in poor condition.
	C3020410	VAT (Resilient Flooring)	System	Beyond Useful Life	Renew System	1	Ea.	\$281,190	\$146,500	\$427,690	Necess ary- 2-5 Yrs	Deferred Maintena nce	The 9x9 vinyl asbestos tile (VAT) floor finishes in buildings at Site 1 are old, beyond useful life, and are in poor condition.
	C3030210	Acoustical Ceilings	System	Beyond Useful Life	Renew System	1	Ea.	\$146,573	\$76,365	\$222,938	Necess ary- 2-5 Yrs	Deferred Maintena nce	Ceiling finishes are typically wood panels that are old, beyond useful life, and damaged. The ceiling finishes at both Site 1 and Site 2 are beyond their useful life and need to be replaced with acoustical ceilings.
	G2020	Parking Lots	System	Beyond Useful Life	Renew System	1	Ea.	\$67,465	\$35,149	\$102,615	Necess ary- 2-5 Yrs	Deferred Maintena nce	Asphalt surface parking is available on-site at both Site 1 and Site 2 and is in fair to poor condition with patches done over time. The parking surface is severely damaged with cracks and pot holes. The road surface is damaged at both sites.

Facility Executive Summary

Facility: \Other\Facilities Administration Bldg.**Address:** 13300 Old Marlboro Pike, Upper Marlboro, MD 20772**Attributes:**

Historical Building	No
Legislative	25
Original Building	Built in 1954, 17,221 S.F.
School Addition 1	Built in 1959, 2,039 S.F.
School Addition 2	Built in 1961, 2,779 S.F.
School Addition 3	Temporary Area, 4,800 S.F.
School Board District	5
School Grade	NA

General Information:

Function:	Office
Gross Area:	22,039 S.F.

Year Built:
Last Renovation:**Facility Description:**

The Facilities Administration Building is a two-story, 22,039 square foot facility close to MD Route 4 in Upper Marlboro, MD. The original building was constructed in 1954 and additions were constructed in 1959 and 1961. It also has a temporary area (four modular buildings) totaling 4,800 S.F. The building originally served as an elementary school until 1980, when it was renovated and converted into an administration building.

ACCESSIBILITY ISSUES

The building has two floors and exterior ramps to access both floors. The main entrance has push button wall switches and automatic door openers. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade with concrete footings. The building does not have a basement.

B. SHELL

The superstructure of the building is load bearing masonry walls and open web steel joist roof framing. The exterior enclosure is comprised of walls of brick veneer over CMU, single panel metal windows with operable frames, and hollow metal steel exterior doors. Roofing is low-slope built-up roof with stone ballast and flashing with repairs done in 2007. A complete re-roofing was completed in 2008.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors, drywall, and wood paneling. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, toilet accessories, shelving, handrails, and toilet partitions. Stair construction includes steel frame with concrete risers and treads with concrete finishes. The interior wall finishes are typically painted CMU and drywall, with plaster on some walls. Floor finishes are typically vinyl asbestos tile and carpet. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 19,800 square feet of 9x9 vinyl asbestos tiles and 370 square feet of 12x12 vinyl asbestos tiles. The ceiling finishes are typically 2x2 or 2x4 suspended acoustical panels.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Domestic water distribution is a mixture of galvanized steel and plastic. Sanitary waste system is cast iron. Rain water system is external with roof gutters replaced in 2007.

HVAC

Heating is provided by two oil/gas-fired steam boilers. Cooling is supplied by individual window units for the main building and a rooftop package unit over the central garage. The heating distribution system is a 2-pipe system using radiators and unit ventilators. Wall-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pole mounted transformer. Power distribution from branch panel wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded fluorescents. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

Facility Executive Summary

The fire alarm system consists of audible, but not strobe, annunciators in interior corridors. The system is activated by pull stations, with no smoke detectors. The telephone and data systems are separate. The building includes an internal security system that is actuated by contact devices and is said to be centrally monitored.

Other Electrical Systems

The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed window treatments (metal blinds) and furnishings. The building does not include fixed food service equipment.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Surface parking is available on site where four out of 143 are handicap spaces. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic.

Current Repair Cost: \$3,775,922.73**Replacement Cost:** \$6,006,952.76**FCI:** 62.86%

Year Built:**Last Renovation:****Facility Description:**

Fairmont Heights High School is a four-story, 174,128 square foot facility located on a 15.1-acre site close to Eastern Avenue NE and US Route 50 in Capitol Heights, MD. The original building was constructed in 1950 and additions were constructed in 1951, 1956 and 1983, with major renovation performed in 1983, Phase 1 - Sci CR 11,051 S.F. performed in 2003, Phase 2 - Elevator Replacement performed in 2005, and Major Systems Renovation in Design. This is a school that has been replaced.

ACCESSIBILITY ISSUES

Further study by an ADA Specialist is required to ensure compliance with both Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, but has sub floors (the main entrance is on the fourth floor) of CMU construction.

B. SHELL

The superstructure is load bearing stud walls. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. The cafeteria has aluminum double-pane sliding windows. Exterior doors are hollow metal steel in most areas and some solid core wood is other areas. Roofing is typically low-slope with built-up roof.

C. INTERIORS

Interior partition wall types typically include concrete masonry unit (CMU) and glazed block wainscot. Some classrooms have movable wall partitions. Interior doors are generally solid core/hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, and toilet partitions. Stair construction includes concrete risers and treads with rubber finishes. The interior wall finishes are typically plaster and paint, most corridor wall surfaces are covered by lockers. Floor finishes in common areas are typically terrazzo, vinyl composition tile, ceramic tile, and carpet. Floor finishes in assignable spaces are typically vinyl tile, carpet, and wood. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster and exposed deck.

D. SERVICES**Conveying**

The building has 2 hydraulic elevators.

Plumbing

Fixtures are original except for the low flow toilets, which were installed in 2006. Domestic water distribution consists of copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building has a sprinkler system that was installed in 2000.

HVAC

Heating is provided by two dual fired steam boilers that supply fan coil units, fin tube radiators, and terminal units throughout the building. Cooling is provided by a centrifugal low pressure chiller that has upgraded controls, high efficiency purge, and converted to R-123 refrigerant. Heat pumps and DX split systems address cooling in the gym and kitchen areas. A two pipe central station air handler was added on the roof in 2003. Fresh air is supplied during the heating season by outdoor air inlets on the fan coil units. Ventilation during cooling season is provided by the air handling units and by infiltration. Controls are low voltage electrical thermostats, individual controls on window units and pneumatic. The system is not centrally monitored or controlled.

Electrical

Facility Executive Summary

A pad mounted transformer provides service to the building. Lighting in the corridors has been upgraded. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a 150 KW diesel powered emergency generator.

Communication and Security

The system consists of audible and visual annunciators, manual pull stations and heat/smoke detectors. The system was replaced in 1995. Kitchen range hood lacks a fire suppression system. Telephone and data systems are separate. The security system consists of motion sensors and a limited CCTV system.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, laboratory, medical equipment and food service equipment. The building also has fixed casework, floor grilles and mats, and window treatments. The grease trap is not in use.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on site where four out of 142 spaces are handicap spaces. Landscaping is not irrigated. Drainage is handled by surface discharge. There is site lighting in the rear and side parking lots. The building has an underground fuel storage tank.

School Board District	8
School Grade	NA

General Information:

Function:	Other
Gross Area:	42,995 S.F.

Year Built:
Last Renovation:**Facility Description:**

Green Valley Academy (Alternative MS/HS) is a two-story, 42,995 square foot facility located close to Interstate 495 (Capital Beltway) in Temple Hills, MD. The original building was constructed in 1956 and additions were constructed in 1960 and 1987 (Five Classroom Modular - State Owned), with major renovation performed in 2005, when the school building was closed and reopened as an alternative MS/HS.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. Path of travel, exterior and interior access ramps, and vertical conveyance systems within the building are not ADA compliant. There are no ADA compliant restroom facilities within the school. Fire alarm system is audible with limited strobes. A study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade and concrete footings. The building does not have a basement, cellar, or sub-floor.

B. SHELL

The superstructure is steel frame, concrete frame, and load bearing masonry walls. Floor construction is slab on grade and metal pan with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer. Exterior windows are aluminum and steel sash with fixed and operable single-pane glazing. Exterior doors are hollow metal. Roofing is typically flat and low-slope with built-up roof.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, toilet partitions. Stair construction includes steel risers and treads with tile finishes. Interior wall finishes are typically painted masonry. Floor finishes in common areas are typically terrazzo, vinyl composition tile and carpet. Floor finishes in assignable spaces are typically vinyl tile, carpet, and wood. Ceiling finishes in common areas are typically 12x12 suspended acoustical tile and 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically 2x2 or 2x4 suspended acoustical panels.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Water is provided by the municipal system and is combination of copper and galvanized. Domestic hot water is supplied by a gas-fired hot water heater and a pump circulating system from a 200 gallon storage tank.

HVAC

Heat is provided by two gas and fuel oil fired, low pressure steam boilers which provide steam to fan/coil units, unit ventilators and radiators. The boilers and ancillary equipment were installed in 1988. Cooling is provided by window A/C units. The 1987 addition has HVAC units in each classroom. Ventilation is provided by roof-top fans. There is a 10,000 gal underground #2 fuel oil storage tank.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service provided by a pad mounted transformer. Lighting is combination recessed, surface, and pendant mounted.

Communications and Security

Facility Executive Summary

The fire alarm system consists of audible/strobe annunciators in common and assignable spaces. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are separate and include dedicated closets or cabinets. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The facility does not have a stand-by emergency electrical generator system.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, medical equipment, and food service equipment. The building also includes fixed casework and window treatments. The kitchen has an exhaust hood without fire suppression. The grease trap is serviced by building personnel.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site where three out of 50 are handicap spaces. Parking striping is in poor condition. Landscaping is mature and is not irrigated. Drainage is handled by area drains. Concrete sidewalks are immediately adjacent to the facility. There is lighting for vehicular and pedestrian night traffic. The water supply is provided from the campus distribution system.

Current Repair Cost: \$7,666,055.59**Replacement Cost:** \$12,131,841.71**FCI:** 63.19%

Facility Description:

Greenbelt Middle School is a partial two-story, 141,125 square foot facility located on a 33.8-acre site close to I-495 (Capital Beltway) in Greenbelt, MD. The original building was constructed in 1937 and additions were constructed in 1945, 1953, 1957, 1962, and 1969, with no major renovation performed, except for Partial Roof Replacement in 2004/2 RTUs and FY05 Code - Fire Alarms in 2006. The main building is considered historic by the City of Greenbelt. There are three temporary/portable classrooms located in the south parking lot, which were added in 2007. This school has been replaced as of 2012.

ACCESSIBILITY ISSUES

A study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade, concrete footings, and foundation walls. The building has a basement of pre-cast construction.

B. SHELL

The superstructure is concrete frame. Floor construction is slab on grade. Roof construction is slab, metal pan with lightweight fill, and wood. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is pitched or low-slope with built-up roof and standing seam metal roofing.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core wood and hollow metal doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, toilet partitions. Stair construction includes steel risers and treads with tile finishes. The interior wall finishes are typically painted. Floor finishes in common areas are typically terrazzo and vinyl composition tile. Floor finishes in assignable spaces are typically VCT. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically 2x2 or 2x4 suspended acoustical panels.

D. SERVICES

Conveying

The building does not include conveying equipment.

Plumbing

Domestic water distribution is a mix of copper, galvanized steel, and plastic. Sanitary waste system is a mixture of cast iron and plastic. Rain water system is internal and external with roof drains and scuppers.

HVAC

Heating is provided by four boilers. Cooling is supplied by rooftop package units and window units. The heating/cooling distribution system is a mixture of ductwork and 2-pipe system using fan coil units, fin tube radiators, and unit ventilators. Fresh air is supplied by infiltration. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are a mix of pneumatic and digital, in different parts of the building, and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

Facility Executive Summary

The electrical service is fed from a pad mounted transformer. Power distribution from branch panel wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded serving recessed, surface-mounted and pendent-mounted fluorescent and incandescent. Lighting was updated in the school during the 2007 year. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are combined. The building does not include an internal security system.

Other Electrical Systems

The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, detention, laboratory, medical equipment, and food service equipment. The building also includes fixed casework, window treatment, floor grilles and mats, multiple seating furnishings. The kitchen has an exhaust hood with fire suppression. Grease trap is serviced by building personnel.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where four out of 131 are handicap spaces and path to building entrance. Landscaping is indigenous, mature, and is not irrigated. Drainage is handled by surface discharge and area drains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system.

Current Repair Cost: \$18,034,058.43**Replacement Cost:** \$35,802,164.32**FCI:** 50.37%

Facility Executive Summary

Facility: \Other\Jesse B. Mason**Address:** 2720 Iverson Street, Temple Hills, MD 20748**Attributes:**

Historical Building	No
Legislative	26
Original Building	Built in 1963, 13,903 S.F.
School Addition 1	Built in 1965, 3,027 S.F.
School Addition 2	Built in 1981, 15,244 S.F.
School Board District	7
School Grade	NA

General Information:

Function:	Other
Gross Area:	32,174 S.F.

Year Built:
Last Renovation:**Facility Description:**

Jesse B. Mason Special Center is a single-story, 32,174 square foot facility located on a 6.1-acre site close to Route 210 (Indian Head Highway) and Interstate 495 (Capital Beltway) in Temple Hills, MD. The original building was constructed in 1963 and additions were constructed in 1965 and 1981, with major renovation also done in 1981. The school has one portable classroom building.

ACCESSIBILITY ISSUES

A further study by an ADA Specialist is required to ensure compliance with Federal and State requirements. .

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is metal joists for roof structure with metal pan and lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with operable single-pane glazing. Exterior doors include hollow metal and aluminum. Roofing is typically low-slope with built-up roof and standing seam metal, which was installed in 2007.

C. INTERIORS

Interior partition wall types typically painted CMU. Interior doors are generally solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, and toilet partitions. The interior wall finishes are typically tile, glazed blocks, and paint. Floor finishes in common areas is typically 9x9 resilient tiles, ceramic tiles and carpet. Floor finishes in assignable spaces is typically 12x12 vinyl tiles, 9x9 resilient tiles, concrete and rubber material in the multi-purpose room. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically 2x2 or 2x4 suspended acoustical panels, plastered ceilings and exposed deck in the multi-purpose room.

D. SERVICES**Conveying**

The building does not have an elevator.

Plumbing

Fixtures are original. Domestic water distribution consists of copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is a combination of internal with roof drains and gutters and down spouts. The building does not have a sprinkler system.

HVAC

Heating is provided by gas fired boilers in two boiler rooms that supply air handlers, roof-mounted, multi-zone unit and terminal units throughout the building. Two of the boilers were replaced in 2007. Cooling is provided by a combination of a roof mounted air cooled chiller, which was replaced in 2007, and roof mounted package units. Fresh air is supplied by the air handlers and roof mounted units. Controls are low voltage electrical thermostats, individual controls on window units and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to a main disconnect. Minor circuit additions have been installed to address the air conditioner system. Lighting has been upgraded to electronic ballasts and T-8 lamps. There are battery pack emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a propane powered 15 KW emergency generator.

Communication and Security

The system consists of visible/audible annunciators, manual pull stations, and heat/smoke detectors. Telephone and data systems are separate. The security system consists of motion sensors.

E. EQUIPMENT & FURNISHINGS

Facility Executive Summary

The building includes fixed library, theater and stage (MPR), medical equipment, and food service equipment. The building also includes fixed casework, window treatments, and floor grilles and mats. The kitchen has an exhaust hood without fire suppression. The grease trap is serviced by building personnel.

F. SPECIAL CONSTRUCTION

The building has a swimming pool and associated equipment.

G. SITE

Parking is available on-site where three out of 47 are handicap spaces and a path to building entrances. Landscaping is not irrigated. Drainage is generally handled by surface discharge. The school does not have a fuel oil tank; it uses natural gas.

Current Repair Cost: \$6,375,123.47**Replacement Cost:** \$8,968,108.06**FCI:** 71.09%

Gross Area:	56,505 S.F.

Year Built:
Last Renovation:**Facility Description:**

John Carroll Elementary School is a one-story, 56,505 square foot facility located on a 10-acre site close to I-495 (Capital Beltway) in Landover, MD. The original building was constructed in 1971, with no additions constructed or major renovations performed since that time.

ACCESSIBILITY ISSUES

A further study by an ADA Specialist is required to insure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade and concrete footings and foundation walls. The building has a crawl space of cast-in-place concrete construction.

B. SHELL

The superstructure is load bearing masonry walls. Floor construction is slab on grade. Roof construction is a built up roof system on a concrete slab. Exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with operable single-pane glazing. Exterior doors are solid core wood with hollow metal frames. Roofing is low-slope with built-up roof.

C. INTERIORS

Interior partition wall types typically include painted CMU and glazed block wainscot. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers toilet accessories, shelving, handrails, and toilet partitions. Interior wall finishes are typically painted CMU and glazed block. Floor finishes in common areas are typically ceramic tile, vinyl asbestos tiles, carpet, and wood. Floor finishes in assignable spaces are typically vinyl asbestos tiles, terrazzo, and carpet. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 34,000 square feet of 12x12 vinyl asbestos tiles. Ceiling finishes in common areas are typically 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are 2x4 suspended acoustical panels. According to the A.H.E.R.A. Management Plan, the school contains 40,000 square feet of asbestos containing fissured 2x4 ceiling tiles and 3,133 square feet of encapsulated asbestos ceiling.

D. SERVICES**Conveying**

The building does not have conveying system.

Plumbing

Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by a gas hot water heater.

HVAC

Heating is provided by two gas fired boilers installed in 2007. Cooling is supplied by air-cooled chiller and two roof top units. The air handling units were replaced in 2008. The heating/cooling distribution system is a ductwork, 2-pipe, and air handler. Fresh air is supplied by infiltration and air handlers. Ceiling exhaust fans are in restrooms. Controls and instrumentation are centrally controlled by an energy management system.

Fire Protection

The building has fire sprinklers. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer. Power distribution wiring is typically copper. Lighting and branch wiring is 3-wire grounded serving recessed, surface-mounted, and pendent-mounted fluorescent and incandescent. Emergency power and emergency lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system was replaced in 2008. Telephone and data systems are combined. The building includes an internal security system that is actuated by optical and contact devices and is centrally monitored.

Facility Executive Summary

Other Electrical Systems: The building has a 7.5 KW emergency generator.

E. FURNISHINGS & EQUIPMENT

The building includes fixed library, theater and stage, audio-visual, medical equipment, and food service equipment. The building also includes fixed casework, window treatments, floor grilles and mats, and furnishings. The kitchen has an exhaust hood without fire suppression. The grease trap is serviced by building personnel.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site where two out of 83 are handicap spaces. Landscaping is indigenous, and is not irrigated. Drainage is generally handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school does not have a fuel oil tank.

Current Repair Cost: \$7,479,476.94**Replacement Cost:** \$13,957,779.68**FCI:** 53.59%

Year Built:
Last Renovation:**Facility Description:**

John E. Howard Elementary School is a two-story, 59,997 square foot facility located on a 10.0-acre site in Capitol Heights, MD. The original building was constructed in 1968, no additions constructed or major renovations performed since that time.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. The building's construction was prior to any consideration for the physically challenged. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, or sub-floor.

B. SHELL

The superstructure is steel framed and masonry constructed. Floor construction is slab on grade and metal pan with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer. Exterior windows are aluminum sash with fixed and operable single-pane and double pane glazing. Exterior doors are hollow metal steel. Roofing is typically flat with built-up roof.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes steel risers and treads with rubber finishes. Interior wall finishes are typically painted CMU or exposed brick finish. Floor finishes in common areas are typically vinyl composition tile and carpet. Floor finishes in assignable spaces is typically vinyl tile. Ceiling finishes in common areas and assignable areas are typically 1x1 suspended acoustical tiles.

D. SERVICES**Conveying**

The building does include conveying equipment.

Plumbing

Fixtures are original. Domestic water distribution is copper and galvanized steel. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by a gas-fired hot water heater with 200 gallon storage tank and circulation system, which was installed in 1998.

HVAC

Heating is provided by two hot water boilers, which were installed in 2007. Cooling is supplied by two water cooled reciprocating chillers. The heating and cooling water is distributed with a pumped 2-pipe system that is a 6-zone system serving 25 air handling units with ducted systems throughout the facility. Fresh air is supplied by air handling units. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building has a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer. Power distribution from branch panels wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded serving recessed, surface-mounted and pendent-mounted fluorescent and some incandescent. Emergency power and lighting are present and exit signs are present at exit doors and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in common spaces and interior corridors, etc. The system is activated by pull stations and/or smoke detectors) and is centrally monitored. The telephone and data systems are separate. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The building has a 75kW emergency generator.

Facility Executive Summary

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, medical equipment, and food service equipment. The building also includes fixed window treatment furnishings. The kitchen has an exhaust hood without fire suppression. The grease trap is serviced by building personnel.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site where one out of 50 are handicap spaces. Landscaping is mature and is not irrigated. Drainage is generally handled by area drains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school has a 6,000 gallon fuel oil tank reportedly of dual wall construction with level and leak detection systems.

Current Repair Cost: \$9,765,434.44**Replacement Cost:** \$14,812,603.60**FCI:** 65.93%

Facility Executive Summary

Report Date: 08 Sep 2012

Facility: \Other\Judith P. Hoyer Montessori

Address: 2300 Belleview Avenue, Cheverly, MD 20785

Attributes:

School Area	2
Congressional	4
County Council	5
Historical Building	No
Legislative	47
Original Building	Built in 1922, 3,726 S.F.
School Addition 1	Built in 1930, 4,782 S.F.
School Addition 2	Built in 1948, 21,679 S.F.
School Addition 3	Built in 1951, 5,614 S.F.
School Board District	4
School Grade	NA

General Information:

Function:	Other
Gross Area:	35,801 S.F.

Year Built:

Last Renovation:

Facility Description:

Judith P. Hoyer Early Childhood Center is a four-story, 35,801 square foot facility located on a 5.9-acre site close to US Route 50 and MD Route 295 (Baltimore-Washington Parkway) in Cheverly, MD. The original building was constructed in 1922 and additions were constructed in 1930, 1948 and 1951, with no major renovation performed.

ACCESSIBILITY ISSUES

A Further study by an ADA Specialist is required to ensure compliance with both Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building has a basement of formed, poured concrete construction.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill, reconstructed in 1991/1992. The exterior enclosure is comprised of walls of brick veneer over CMU and concrete panels. Exterior windows are steel, vinyl sash with operable single-pane glazing. Exterior doors are solid core wood. Roofing is typically low-slope with built-up roof. The roof will be replaced as part of the 2013 FY CIP.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core/hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics toilet accessories, shelving, handrails, and toilet partitions. Stair construction includes concrete risers and treads with terrazzo finishes. The interior wall finishes are typically plaster, ceramic tile, and paint on CMU. Floor finishes in common areas are typically terrazzo, ceramic tile and vinyl composition tile. Floor finishes in assignable spaces are typically vinyl tile, carpet and wood. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 20,600 square feet of 9x9 vinyl asbestos tiles. Ceiling finishes in common areas are typically plaster, 1x1 suspended acoustical tile, 2x2 or 2x4 suspended acoustical panels, and painted and exposed concrete. Ceiling finishes in assignable areas are typically 1x1 suspended acoustical tile and 2x2 or 2x4 suspended acoustical panels. Also according to the A.H.E.R.A. Management Plan, the school contains 3,975 square feet of asbestos containing plaster ceiling.

D. SERVICES:

Conveying

The building does not include conveying equipment.

Plumbing

Domestic water distribution is a combination of copper and galvanized steel. Sanitary waste system is cast iron. Rain water system is external with gutters and down spouts.

HVAC

Heating is provided by two dual fuel steam boilers. Cooling is supplied by individual window units. The heating distribution system is a 2-pipe system using fan coil units, fin tube radiators and a few cast iron radiators. Fresh air is supplied by infiltration. Ceiling mounted exhaust fans are installed in bathrooms. Controls and instrumentation are manual, pneumatic, hybrid and are not centrally controlled by an energy management system.

Fire Protection

The building has a fire sprinkler system in the boiler room only. Fire extinguishers are wall mounted

Electrical

Facility Executive Summary

The electrical service is fed from a pole mounted transformer. Power distribution from branch panels wiring is typically copper. Panels include screw in glass fuses. Lighting and branch wiring is typically 3-wire grounded serving surface-mounted and pendent-mounted fluorescent. Fixtures were upgraded in the mid-1990s. Emergency battery pack lighting is present and exit signs are present at exit doors and near stairways and are typically illuminated. The building does not have an emergency generator.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are separate. The building includes an internal security system that is actuated by contacts and motion sensors and is centrally monitored.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, medical equipment, and food service equipment. The building also includes fixed casework furnishings and window treatments. The kitchen has an exhaust hood with fire suppression. Grease trap is serviced by building personnel.

F. SPECIAL CONSTRUCTION

The building does not include any special construction.

G. SITE

Surface parking is available on site where three out of 44 are handicap spaces. Landscaping is indigenous and is not irrigated. Drainage is generally handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. There is an underground dual wall fuel tank with level and leak detection.

Current Repair Cost: \$5,635,948.67**Replacement Cost:** \$9,097,876.63**FCI:** 61.95%

Year Built:
Last Renovation:**Facility Description:**

Lyndon Hill Elementary School is a three-story, 52,342 square foot facility located on a 7.1-acre site on Central Avenue in Capital Heights, MD. The original building was constructed in 1938 and additions were constructed in 1958 and 1970, with no major renovations. The building has been out of service as a school for over two years and was until recently used as a training facility for the Prince George's County Police Department.

ACCESSIBILITY ISSUES

A further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade, concrete footings, and foundation walls. The building has a basement of cast-in-place and CMU construction.

B. SHELL

The superstructure is concrete frame. Floor construction is concrete slab. Roof construction is metal pan with lightweight fill and built-up roofing with felt and hot asphalt. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core wood doors, with hollow metal frames. Interior fittings include chalk and tack boards, toilet accessories, shelving, handrails, and toilet partitions. Stair construction includes steel risers and treads with terrazzo finishes. The interior wall finishes are typically painted. Floor finishes in common areas are typically terrazzo and VCT. Floor finishes in assignable spaces are typically vinyl tile with some carpet. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 25,775 square feet of 9x9 vinyl asbestos tiles. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically 2x2 or 2x4 suspended acoustical panels.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Domestic water distribution is a mixture of copper and galvanized steel. Sanitary waste system is mostly cast iron with limited areas of plastic. Rain water system is a mixture of internal and external roof drains and scuppers.

HVAC

Heating is provided by steam boilers that were installed in 2005. There are two rooftop package units on Addition 2. Cooling is supplied by window units in the original building in each class room, two rooftop units on Addition 1, and two rooftop package units on Addition 2. The heating/cooling distribution system is a mixture of ductwork, 2-pipe, and radiant system using a mixture of air handlers, radiators and unit ventilators. Fresh air is supplied by infiltration. Ceiling/wall -mounted exhaust fans are installed in restrooms. Controls and instrumentation are a mixture of pneumatic and digital and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pole mounted transformer. Power distribution from branch panel wiring is typically copper. Branch wiring is typically 3-wire grounded, serving a mixture of recessed, surface-mounted, and pendent-mounted fluorescent and incandescent light fixtures. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

Facility Executive Summary

The fire alarm system consists of audible annunciators in common spaces and interior corridors. The system is activated by pull stations and smoke detectors and is centrally monitored. The telephone and data systems are combined and include dedicated closets or cabinets. The building does not include an internal security system, but does include external cameras.

Other Electrical Systems

The building has a 9.4 KVA emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes library and multipurpose room. The building does not include fixed casework, window treatment, or other school-functional furnishings. The kitchen is not operational and no longer serves food.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site where two out of 42 are handicap spaces there are paths leading to building entrances. Landscaping is indigenous and is not irrigated. Drainage is generally handled by surface discharge and area drains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system and appears to be in poor condition. The school has an 8,000 gallon underground storage tank that was replaced in 2003.

Current Repair Cost: \$9,030,464.51**Replacement Cost:** \$13,684,044.98**FCI:** 65.99%

School Board District	7
School Grade	NA

General Information:

Function:	Office
Gross Area:	36,493 S.F.

Year Built:
Last Renovation:**Facility Description:**

Owens Road Elementary School is a one-story, 36,493 square foot facility located on a 10-acre site close to I-495 (Capital Beltway) in Oxon Hill, MD. The original building was constructed in 1965, with no additions constructed or major renovations performed since that time.

ACCESSIBILITY ISSUES

A further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on a slab-on-grade. The building does not have a basement, cellar, or sub-floor, but does have a crawl space.

B. SHELL

The superstructure is load bearing masonry walls with slab-on-grade floor and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over concrete masonry unit (CMU), single pane metal windows with operable frames, and hollow metal steel doors. Exterior doors throughout the building are original. Roof construction is low-slope built-up roof with gravel ballast and flashing. The roof was replaced in 1998.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. The facility does not have stair construction. Interior wall finishes are typically painted CMU. Floor finishes throughout the building are typically vinyl asbestos tiles (VAT). During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 30,000 square feet of 9x9 vinyl asbestos tiles. The overall ceiling finishes are typically suspended perforated acoustical tiles.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Fixtures are mostly original. Domestic water distribution is primarily copper. Sanitary waste system is cast iron. Rain water system is external with roof drains and scuppers. Domestic hot water is provided by a gas hot water heater.

HVAC

Heating is provided by two gas-fired boilers. Cooling is supplied by window units. The heating/cooling distribution system is a 2-pipe for heating system using fan coil units and radiators. A separate water heater with storage capacity tank was installed to provide domestic hot water. Fresh air is supplied by infiltration and air handling units. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building does not have fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pole mounted. Power distribution wiring is typically copper. Lighting and branch wiring is serving surface-mounted and pendent-mounted fluorescent. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in interior corridors. The system is activated by pull stations and is not centrally monitored. The telephone and data systems are separate and do not include dedicated closets or cabinets. The building includes an internal security system that is actuated by contact devices and is centrally monitored.

Other Electrical Systems: The building has an emergency generator.

Facility Executive Summary

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, medical equipment, food service equipment. The library has shelves and tables/chairs. The nurse's room has one bed. The building has a stage with lights and curtains. The building also includes fixed casework/cabinetry in the classrooms, window treatments, and multiple seating furnishings (folding chairs and tables) in the cafeteria.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Asphalt surface parking is available on-site where there are three reserved handicap spaces out of total 30 parking spaces. The bus drop-off zone at the front entrance is covered. Drainage is generally handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic.

Current Repair Cost: \$6,818,867.73**Replacement Cost:** \$9,561,121.81**FCI:** 71.32%

General Information:

Function:	Office
Gross Area:	91,265 S.F.

Year Built:
Last Renovation:**Facility Description:**

Oxon Hill Staff Development is a two-story, 91,265 square foot administrative/office building located close to MD Route 210 (Indian Head Highway) in Oxon Hill, MD. The original building was constructed in 1948, with no additions constructed or major renovations performed since that time.

ACCESSIBILITY ISSUES

A further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls. The building has a basement of concrete construction.

B. SHELL

The superstructure is load bearing masonry walls and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over CMU, single pane metal windows with operable frames, and hollow metal steel doors. The exterior doors throughout the building are original. Roofing is typically low-slope, built-up roof with gravel ballast and flashing. The roof was replaced in November 2007.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors and drywall (on the second floor). The interior doors are generally solid core wood with hollow metal frames. Interior fittings include toilet accessories, handrails, and toilet partitions. Stair construction includes concrete risers and treads with terrazzo finishes. There is a metal ladder to access the roof hatch.

Interior wall finishes are typically painted CMU and drywall. The floor finishes throughout the building are typically terrazzo, vinyl composition tile (VCT), and carpet. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 6,000 square feet of 12x12 vinyl asbestos tiles and 1,100 square feet of 9x9 vinyl asbestos tiles. The overall ceiling finishes are typically 2x2 or 2x4 suspended perforated acoustical tiles.

D. SERVICES**Conveying**

The building does not include an elevator.

Plumbing

Domestic water distribution is copper and plastic. Sanitary waste system is cast iron. Rain water system is internal and external with roof drains. The system was upgraded in June 2007.

HVAC

Heating is provided by three low-pressure, gas-fired boiler units. Cooling is supplied by rooftop package units and temporary window units. The heating/cooling distribution system is a radiant system using air handlers, unit ventilators, and radiators. Fresh air is supplied by air handling units. Ceiling-mounted exhaust fans in restrooms and were updated in June 2007. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system. The second floor is using window units.

Fire Protection

The building has a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pole mounted transformers that delivers 120/208 V., 3-phase, 4-wire power to a main panel. Power distribution from branch panel wiring is typically copper, 3-wire grounded and is inadequate, the system trips. Lighting and branch wiring is typically 3-wire grounded serving surface-mounted fluorescents. Illumination is generally inadequate throughout. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated, although a few are not.

Communications and Security

Facility Executive Summary

The fire alarm system consists of audible with no strobe annunciators in interior corridors and appears not to comply with ADA requirements. The system is activated by pull stations and is centrally monitored, but has no smoke detectors. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are combined and include dedicated closets or cabinets. The building includes an internal security system that is actuated by contact devices and is centrally monitored.

Other Electrical Systems

The building has an emergency generator, but it does not work and needs to be updated.

E. EQUIPMENT & FURNISHINGS

The building includes theater and stage equipment, e.g., curtains and lights and food service equipment. The building also includes fixed casework/cabinetry in the old classrooms, window treatments, and multiple seating furnishings (folding chairs and tables). Fixed seating in the 350-person capacity auditorium.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Asphalt surface parking is available on site and where there are seven reserved handicap spaces out of total 127 parking spaces. Drainage is generally handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic.

Current Repair Cost: \$13,525,870.24**Replacement Cost:** \$22,845,764.54**FCI:** 59.21%

The road surface is in fair condition with some damage. There is sufficient parking capacity for the occupants, but it is insufficient for special functions, meetings, and conferences. Parking striping is old, worn, and in poor condition.
	G2030	Pedestrian Paving	System	Beyond Useful Life	Renew System	1	Ea.	\$44,520	\$23,195	\$67,715	Necess ary- 2-5 Yrs	Deferred Maintena nce	Concrete sidewalks immediately adjacent to the facility are old and in fair condition.
	B2020	Exterior Windows	System	Beyond Useful Life	Renew System	1	Ea.	\$248,241	\$129,333	\$377,574	Necess ary- 2-5 Yrs	Deferred Maintena nce	Most of the metal windows throughout the building are original, beyond useful life, and in fair condition. Some windows on the first floor were replaced in 1987, but most of them do not operate properly. Water leaks were reported through windows on the second floor. The flashing and caulking around the windows are beyond their useful life and in fair to poor condition. The single pane windows are not energy efficient.
	B2030	Exterior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$240,027	\$125,054	\$365,081	Necess ary- 2-5 Yrs	Deferred Maintena nce	The exterior doors and hardware throughout the building are original, beyond useful life, and in fair to poor condition. The entrance doors for both first and second floor have ADA compliant signage.
	C1020	Interior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$163,364	\$85,113	\$248,477	Necess ary- 2-5 Yrs	Deferred Maintena nce	The interior doors are beyond useful life and need to be repainted. The door hardware is in fair to poor condition. Some interior doors do not have locks and several thefts were reported in the past.
	C1030	Fittings	System	Beyond Useful Life	Renew System	1	Ea.	\$235,464	\$122,677	\$358,140	Necess ary- 2-5 Yrs	Deferred Maintena nce	The interior fittings in the building include toilet accessories, handrails, and toilet partitions. The metal toilet partitions are original, rusted, stained, and in poor condition. All of the old toilet accessories are beyond their useful life and need to be replaced. The metal hand rails in the gang restrooms are in fair condition.

School Board District	5
School Grade	NA

General Information:

Function:	Office
Gross Area:	107,411 S.F.

Year Built:
Last Renovation:**Facility Description:**

The Sasscer Administration Building is a multi-story, 107,411 square foot facility located close to MD Route 4 in Upper Marlboro, MD. The original building was constructed in 1949 and additions were constructed in 1962, 1967, 1984, and 1996 (print shop). The building served as a middle school until 1984, when it was renovated and converted for administrative use.

ACCESSIBILITY ISSUES

A further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on a slab-on-grade with concrete footings and foundation walls. The building has a basement of cast-in-place concrete construction.

B. SHELL

The superstructure of the building is load bearing masonry walls and open web steel joist roof framing. The exterior enclosure is comprised of walls of brick veneer over CMU, single pane metal windows with operable frames, and hollow metal steel exterior doors. Roofing is low-slope, built-up roof with stone ballast and flashing.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors and drywall. Interior doors are generally solid core wood doors. Stair construction consists of concrete risers and treads with rubber/vinyl floor finishes in fair to good condition. Interior wall finishes are typically painted CMU and drywall. The floor finishes in building is typically terrazzo, 12x12 vinyl composition tile, carpet, and a small portion has 9x9 vinyl asbestos tiles. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 3,400 square feet of 9x9 vinyl asbestos tiles and 2,050 square feet of 12x12 vinyl asbestos tiles. Ceiling finishes are typically 2x2 or 2x4 suspended acoustical panels.

D. SERVICES**Conveying**

The building includes an elevator.

Plumbing

Fixtures are original. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal with roof drains.

HVAC

Heating is provided by two gas-fired boilers which were installed in 1988. Cooling is supplied by water-cooled chillers updated June 2007. The heating/cooling distribution system is ceiling mounted fan coil units and ductwork. Fresh air is supplied by air handling units. Wall-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic.

Fire Protection

The building does not have a fire sprinkler system throughout. The only portions of the building that are sprinkled are the storage and mechanical rooms. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pole mounted transformer. Power distribution from branch panels wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded serving recessed fluorescent in fair condition. Emergency power and lighting are present via a 250 KW propane-fired emergency generator. Exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

Facility Executive Summary

The fire alarm system consists of audible, strobe annunciators. The system is activated by pull stations, is located in interior corridors. The telephone and data systems are separate and include dedicated closets or cabinets that are secured. The building includes an internal security system that is actuated by contact. It has a dedicated grounding system, but no lighting protection. Security system is centrally monitored.

Other Electrical Systems: The building has a 250kW emergency generator.

E. EQUIPMENT & FURNISHINGS

The building does not include theater and stage, audio-visual, laboratory equipment, food service equipment. The audio-visual room and science laboratories are not in use after the school was converted to an administrative building. The building does include fixed window treatment (metal blinds) and furnishings.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Surface parking is available on-site. There are 12 handicap spaces out of total 401 parking spaces. There is sufficient parking capacity for the staff members.

Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic.

Facility: \Other\Thomas Addison Alternative School**Address:** Oxon Hill Road, Oxon Hill, MD 20745**Attributes:**

Historical Building	No
Original Building	Built in 1958, 19,985 S.F.
School Addition 1	Built in 1960, 5,453 S.F.
School Grade	NA

General Information:

Function:	Other	Year Built:
Gross Area:	25,438 S.F.	Last Renovation:

Facility Description:

Thomas Addison Alternative School is a one-story, 25,438 square foot facility located on a 7.1-acre site close to Route 210 (Indian Head Highway) and Interstate 495 (Capital Beltway) in Oxon Hill, MD. The original building was constructed in 1958 and an addition was constructed in 1960, with no major renovation.

ACCESSIBILITY ISSUES

A further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, or sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel at the main entrance and aluminum at other locations. Roofing is typically very low-slope with built-up roof, standing seam metal, and asphalt composition roofing.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving and toilet partitions. There is no stair construction in this building. Floor finishes in common areas are typically terrazzo and vinyl composition tile. Floor finishes in assignable spaces is typically vinyl tile and carpet. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 20,000 square feet of 9x9 vinyl asbestos tiles. Ceiling finishes in common areas are typically 1x1 suspended acoustical tile and 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster.

D. Services**Conveying**

The building does not have an elevator.

Plumbing

Fixtures are original. Domestic water distribution is copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building has sprinklers in the janitors closets only.

HVAC

Heating is provided by two steam, gas fired boilers that supply fan coil units and fin tube radiators throughout the building. Cooling is provided by individual window units for each classroom and a split cooling only package unit for the church. Fresh air is supplied mostly by infiltration. Controls are low voltage electrical thermostats, individual controls on window units, and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pole mounted transformer provides service to a main disconnect. Minor circuit additions have been installed to address the window air conditioner power. Lighting in the classrooms has 40w fluorescent lamps and hard ballasts. There are battery pack emergency lights in the corridors and exit signs are properly placed and illuminated. The building does not have an emergency generator.

Communication and Security

The system consists of audible annunciators, manual pull stations, and heat/smoke detectors. Kitchen range hood lacks a fire suppression system. Telephone and data systems are separate. The security system consists of motion sensors.

E. EQUIPMENT & FURNISHINGS

The building includes fixed casework and window treatments. The kitchen is not functional.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

Facility Executive Summary

G. SITE

Surface parking is available on-site. There is insufficient parking capacity for occupants where none of the 38 is handicap spaces. Landscaping is not irrigated. Drainage is generally handled by surface drainage.

Current Repair Cost: \$4,969,690.33**Replacement Cost:** \$6,574,829.27**FCI:** 75.59%

Facility: \Other\Valley View Elementary

Address: 5500 Danby Avenue, Oxon Hill, MD 20745

Attributes:

School Area	2
Congressional	4
County Council	8
Historical Building	No
Legislative	26
Original Building	Built in 1968, 48,231 S.F.
School Addition 1	Built in 1990, 4,200 S.F.
School Board District	8
School Grade	PreK-6th

General Information:

Function:	Other
Gross Area:	52,431 S.F.

Year Built:
Last Renovation:

Facility Description:

Valley View Elementary School is a one-story, 52,431 square foot facility located on a 14.5-acre site close to I-495 (Capital Beltway) in Oxon Hill, MD. The original building was constructed in 1968 and an addition was constructed in 1990 (four Modulares), with no major renovation performed.

ACCESSIBILITY ISSUES

A further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on a slab-on-grade that. The building does not have a basement, cellar, or sub-floor, but does have a crawl space.

B. SHELL

The superstructure is load bearing masonry walls, slab-on-grade floor, and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over concrete masonry unit (CMU), single pane metal windows with operable frames, and hollow metal steel doors. Most of the classrooms have a fire window exits. The original building has low-slope built up roof with gravel ballast that was replaced in 2006. The 1990 addition has EPDM roof.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. Interior wall finishes are typically painted CMU walls. Floor finishes throughout the building are typically 9x9 vinyl asbestos tiles (VAT), 12x12 vinyl composition tiles (VCT), carpet, and ceramic tiles. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 46,000 square feet of 9x9 vinyl asbestos tile and 270 square feet of 12x12 vinyl asbestos tiles. The overall ceiling finishes are typically suspended 2x2 and 2x4 acoustical tiles. The school had 39,300 square feet of asbestos containing 2x4 acoustical ceiling tiles that were replaced in 2008.

D. SERVICES

Conveying

The building does not include conveying equipment. There is a metal ladder to access the roof hatch.

Plumbing

Toilets were replaced throughout the building in 2007. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal and external with roof drains and scuppers.

HVAC

Heating is provided by two gas/oil-fired boilers. Cooling is supplied by window units. The heating/cooling distribution system is a 2-pipe system using unit ventilators and fin-tube radiators. Fresh air is supplied by infiltration, thru building, and air handling units in cafeteria. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building has a minimal fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pole mounted transformer. Power distribution (from branch panels) wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded serving suspended fluorescent lights. The system was updated in 2007. Emergency lighting is present in corridors. Exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

Facility Executive Summary

The fire alarm system consists of audible annunciators in interior corridors. The system is activated by pull stations and is centrally monitored. The telephone and data systems are combined. The building includes an internal security system that is actuated by contact devices, but no surveillance, and is centrally monitored.

Other Electrical Systems: The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, medical equipment, food service equipment and two grease trap interceptors. The school has a stage with lights and curtains. The building also includes fixed casework/cabinetry in the classrooms, window treatments, and multiple seating furnishings (folding chairs and tables) in multi-purpose room.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Asphalt surface parking is available on-site where there are two reserved handicap spaces out of total 55 parking spaces. The parking lot was resurfaced and the curbs were repainted in 2007. The bus loading/unloading area is covered. Drainage is generally handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic.

Current Repair Cost: \$9,220,249.15**Replacement Cost:** \$13,774,197.23**FCI:** 66.94%

General Information:

Function:	Middle School	Year Built:
Gross Area:	101,862 S.F.	Last Renovation:

Facility Description:

Benjamin Stoddert Middle School is a four-story, 101,862 square foot facility located on a 13.3-acre site close to Interstate 495 (Capital Beltway) in Temple Hills, MD. The original building was constructed in 1957 and additions were constructed in 1963 and 1995, with major renovation done in 1995.

ACCESSIBILITY ISSUES

In general, the facility is not in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements. Entrance ramps do not have change of color and texture, some doors have knobs instead of levered opening devices, and handicap accessible toilet stalls were not observed. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building has a basement and a crawl space of cast-in-place concrete construction.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade for the basement floor and metal pan with lightweight fill for the upper floors. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are generally hollow metal steel. Roofing is typically very low-slope with built-up roof and standing seam metal.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core/hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving and toilet partitions. Stair construction includes concrete risers and treads with steel and tile finishes. The interior wall finishes are typically painted CMU, glazed block, and ceramic wall tiles. Floor finishes in common areas is typically terrazzo, carpet and vinyl composite tile. Floor finishes in assignable spaces are typically vinyl tile, carpet, wood and ceramic floor tiles. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster, suspended acoustical panels and exposed deck.

D. SERVICES

Conveying

The building has two elevators.

Plumbing

Fixtures are original, except low flow toilets installed around 2007. Domestic water distribution is original and consists of copper piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building has a sprinkler system.

HVAC

Heating is provided by two dual fired boilers that supply fan coil units, fin tube radiators, and terminal units throughout the building. Cooling is provided an air cooled chiller. An ice based thermal storage system has been installed. Distribution is by a 2-pipe system to fan coil units. Fresh air is supplied mostly by infiltration. Controls are low voltage electrical thermostats, individual controls on window units and pneumatic. The boilers and chiller thermal storage system are controlled remotely. The building system is not centrally monitored or controlled.

Electrical

Facility Executive Summary

A pad mounted transformer provides service to a main disconnect. Circuit additions have been installed for the chiller and ice storage system, most of the system is original. Lighting has been upgraded to electronic ballasts and T-8 lamps. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has an emergency generator.

Communication and Security

The system consists of audible/visual annunciators, manual pull stations and heat/smoke detectors. Kitchen range hood has a partial coverage fire suppression system. Telephone and data systems are separate. The security system consists of motion sensors and CCTV cameras.

E. EQUIPMENT & FURNISHINGS

The building has fixed casework and cabinets, food service equipment and a grease trap interceptor. The building also has window blinds.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Surface parking is available on-site where four out of 75 are handicap spaces with paths to building entrances. Drainage is generally handled by surface discharge. The site includes concrete sidewalks, site lighting and utility lines including water, sewer, electrical and an above ground fuel tank.

Current Repair Cost: \$15,585,937.92**Replacement Cost:** \$26,445,880.57**FCI:** 58.94%

Function:	Middle School
Gross Area:	161,678 S.F.

Year Built:
Last Renovation:

Facility Description:

Benjamin Tasker Middle School is located on a 15.3-acre site close to MD Route 197 and US Route 50 in Bowie, MD. The two-story, 161,678 square foot facility was constructed in 1970, with no additions constructed or major renovations performed since that time. Minor renovations include heating and cooling system upgrades in 2007 and foodservice equipment in 2012.

ACCESSIBILITY ISSUES

All entrances have curb cuts and wide enough doors for wheel chair access, but lack push button wall switches and automatic door openers. Handicap toilet stalls are available in two gang restrooms on both floors. Toilet configurations and accessories are adequate. Interior graphics and/or signage for ADA compliance are inadequate and missing in most of the building (only parking areas have handicap signs). All programs in the facility are handicap accessible with exception of the stage area. However, further study by an ADA Specialist is required to insure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on the slab-on-grade. The building does not have a basement or crawl space.

B. SHELL

The superstructure is load bearing masonry walls. Roof construction is metal pan with lightweight fill and is resting on open web steel joist roof framing. The exterior enclosure is brick veneer over CMU. Exterior windows are typically aluminum sash with operable single-pane glazing. Exterior doors are hollow metal steel. The facility has low-slope built up roof with gravel ballast. The roof was replaced in 1986.

C. INTERIORS

Interior partition types typically include painted CMU with ceramic tiles in the corridors and two metal folding partition walls in the multi-purpose room. Interior doors, including fire doors with no fire ratings, are generally solid core wood doors with hollow metal frames. Interior fittings in the building include chalk/tack boards, toilet accessories, handrails, and toilet partitions. Stair construction includes concrete risers and treads with tile finishes, and a metal ladder to access the roof hatch.

Interior wall finishes are typically painted CMU and folding metal partitions. Floor finishes throughout the building are typically vinyl asbestos tiles, terrazzo, carpet, and ceramic tiles. There is vinyl asbestos tile floor finish in the second floor corridor and classrooms and terrazzo floor finish in the first floor corridor. Carpet areas include the offices, guidance office, and principals office. The carpet in the library was replaced around 2003. The overall ceiling finishes are typically suspended (mostly needlepoint) acoustical tiles.

D. SERVICES**Conveying**

Conveying equipment includes one hydraulic elevator.

Plumbing

Fixtures are original with some six handicaps but not ADA-compliant facilities. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by an electric hot water heater, which was installed in 1970.

HVAC

Heating is provided entirely by electric coils in the large air handlers, ducts, and fan coil units. Cooling is supplied by a water cooled chiller, which was installed in 2001, and cooling tower, which was replaced in 2004, serving air handlers and fan coil units. Fresh air is supplied by air handling units. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are hybrid and are not centrally controlled by an energy management system. Heating and cooling system was renovated in 2007.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

Facility Executive Summary

The electrical service is fed from the primary distribution system with pad mounted transformers. Lighting and branch wiring is typically 3-wire grounded serving recessed, surface-mounted, and pendent-mounted fluorescent fixtures. Emergency power and battery lighting are present and exit signs are present at exit doors and near stairways.

Communications and Security

The fire alarm system consists of audible annunciators in common spaces and interior corridors, etc. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are separate. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems:

The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, medical equipment, food service equipment that was replaced in 2012 and kitchen grease trap interceptor. The building also includes fixed casework/cabinetry in the classrooms, window treatment, and multiple seating furnishings (folding chairs and tables) in multi-purpose room.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Asphalt surface parking is available on-site where there are eight reserved handicap parking spaces out of total about 190 parking spaces. Drainage is handled by surface discharge. As the building is all electric for HVAC, there is no fuel oil storage tanks installed.

Current Repair Cost: \$25,722,198.64**Replacement Cost:** \$42,031,287.33**FCI:** 61.20%

School Board District	1
School Grade	7th-8th

General Information:

Function:	Middle School
Gross Area:	122,497 S.F.

Year Built:**Last Renovation:****Facility Description:**

Buck Lodge Middle School is a one-story, 122,497 square foot facility located on a 24.5-acre site close to I-295 in Riverdale, MD. The original building was constructed in 1958, additions were constructed in 1966, 1981, and 1992, and major renovation was performed on the original building and addition one in 1992.

This school is part of the Special Education Inclusion Initiative. A 21,000 S.F. building addition and 4,000 S.F. renovation of adjacent space are currently being programmed for a 2014 construction completion that will incorporate the special education program requirements. A parking lot extension will also be included to support the additional staff.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements. The study should include ramp access, door hardware, interior signage, and drinking fountains.

A. SUBSTRUCTURE

The building typically is a slab-on-grade with concrete footings and foundation walls. The building has a crawl space of cast in place concrete construction.

B. SHELL

The superstructure is concrete reinforced masonry with face brick, load bearing CMU, and glaze block walls. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill on built up roof system. The exterior enclosure is comprised of walls of brick veneer over CMU. Windows are aluminum sash with operable single-pane glazing. Exterior doors are hollow metal steel with hollow metal frames. Interior doors are solid core wood with hollow metal frames. Roofing is typically low-slope with built-up roof. A roof replacement for the original building is planned as part of the FY2013 CIP.

C. INTERIORS

Interior partition wall types typically include painted CMU and glaze block wainscot. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, toilet partitions. Stair construction includes concrete risers and treads with tile finishes. The interior wall finishes are typically CMU and glazed block. Floor finishes in common areas is typically terrazzo, VCT, wood and ceramic tile. Floor finishes in assignable spaces is typically VCT, carpet and quarry tile in the kitchen. Ceiling finishes in common areas are typically suspended acoustical tile and Tectum tile. Ceiling finishes in assignable areas are typically suspended acoustical tile.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Most of the plumbing fixtures were replaced during the 1992 renovation. Domestic water distribution is copper. Sanitary waste system is primarily cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by two gas fired hot water heaters with approximately 60 gallon storage capacity.

HVAC

Heating is provided by gas and oil fired boilers. Cooling to the most of the building is supplied by two exterior, ground mounted chillers and one interior air cooled chiller with a roof mounted remote heat discharge unit. The heating and cooling distribution system in the building is a 2-pipe system to above ceiling fan coil units in the corridors, unit ventilators in the classrooms, and rooftop air handling units in the balance of the support spaces. Ceiling-mounted exhaust grilles are installed in restrooms to roof mounted exhaust fans. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Facility Executive Summary

Fire Protection

The building has a fire sprinkler system and is fully sprinkled. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted utility transformer. Power distribution wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded. Lighting is typically troffers in the classrooms and corridors with T-8 lamps. Exterior parking and roadway lighting consists of shoebox HID fixtures on aluminum poles and round concrete bases. Emergency power and lighting are present and exit signs are present at exit doors and are typically illuminated.

Communications and Security

The fire alarm system consists of audible and visual signal devices in common spaces, interior corridors, etc. The system is activated by pull stations and smoke detectors. The telephone and data systems are separate and include dedicated closets or cabinets. The building includes an internal security system that is actuated by contact, optical or combination devices and is centrally monitored.

Other Electrical Systems:

The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, medical equipment, food service equipment and kitchen grease trap interceptor. The building also includes fixed casework, window treatment, floor grilles and mats, and furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site where five out of 108 are handicap spaces and paths to building entrances. Drainage is handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. The school has an 18,000 gallon underground fuel oil tank.

Current Repair Cost: \$11,045,365.60**Replacement Cost:** \$32,262,202.18**FCI:** 34.24%

Year Built:

Last Renovation:

Facility Description:

Charles Carroll Middle School is a three-story, 114,778 square foot facility located on a 17.1-acre site close to I-495 (Capital Beltway) in New Carrollton, MD. The original building was constructed in 1961 and additions were constructed in 1963 and 1970 with major renovation performed in 1970. Other renovation includes FY03 SR Boiler Replacement in 2004, FY05 Code - Fire Alarms in 2006, and FY06 CF Steam Traps in 2006, Unit Ventilator replacement in 2010, and roof replacement in 2012.

This school is part of the Special Education Inclusion Initiative. A 22,000 S.F. building is currently being programmed for a 2016 construction completion that will incorporate the special education program requirements. A parking lot extension will also be included to support the additional staff.

ACCESSIBILITY ISSUES

The facility is not in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements. The study should include access ramps, door hardware, interior signage, and drinking fountains. The ramp in front of the building should be painted and scored.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade and concrete footings and foundation walls. The building's construction is CMU and glaze block.

B. SHELL

The superstructure is reinforced concrete masonry with face brick, CMU load bearing walls and steel bar joist for the roof. Floor construction is slab on grade. Roof construction is steel bar joist with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with operable single-pane glazing. Exterior doors are hollow metal steel with hollow metal frames. Roofing is typically a low-slope built-up roof and was replaced in 2012.

C. INTERIORS

Interior partition wall types typically include painted CMU and glazed block. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, toilet partitions. Stair construction includes steel and concrete risers and treads with tile finishes. The interior wall finishes are typically painted CMU and glazed block. Floor finishes in common areas are typically terrazzo, ceramic tile, vinyl composition tile, and carpet. Floor finishes in assignable spaces is typically vinyl tile, carpet, and wood. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan Report, that the school contains 34,000 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically acoustical tile and suspended acoustical panels. Ceiling finishes in assignable areas are typically suspended acoustical panels. Also according to the A.H.E.R.A. Management Plan, the school contains 15,000 square feet of asbestos containing suspended acoustical panels.

D. SERVICES

Conveying

The building has one hydraulic elevator. The elevator has its own new emergency generator.

Plumbing

The facility contains sinks, faucets, urinals, toilets and other plumbing fixtures. The water fountains are original. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by gas hot water heater.

HVAC

Facility Executive Summary

Heating is provided gas/oil fired boilers, which were installed in 2003. Cooling is supplied mostly by window units and roof top packaged units. The heating/cooling distribution system is ductwork, 2 pipe, air handlers, and unit ventilators. Unit ventilators were upgraded in 2010. Fresh air is supplied by infiltration and air handlers. Ceiling exhaust fans are in restrooms. Controls and instrumentation are mostly pneumatic for the heating system and digital for the roof top units and not centrally controlled by an energy management system.

Fire Protection

The building has fire sprinkler system in most of the occupied areas. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer. Power distribution wiring is typically copper. Lighting and branch wiring is serving recessed, surface-mounted, and pendent-mounted fluorescent and incandescent. Emergency power and lighting is present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system was replaced in 2008. The telephone and data systems are separate and not included in dedicated closets or cabinets. The building includes an internal security system that is actuated by optical and contact devices and is centrally monitored.

Other Electrical Systems:

The building has two emergency generators.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, medical equipment, food service equipment and kitchen grease trap interceptor. The building also includes fixed casework, window treatment, floor grilles and mats, and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site where are two handicap spaces out of the 67 and paths to building entrances. Drainage is handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school has a 15,000 gallon fuel oil tank of dual wall construction.

Current Repair Cost: \$19,833,958.83**Replacement Cost:** \$30,821,489.50**FCI:** 64.35%

Facility Executive Summary

Report Date: 08 Sep 2012

Facility: \Middle Schools\Charles Carroll Middle_Original Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems D3050		Terminal & Package Units	System	Beyond Useful Life	Renew System	1	Ea.	\$13,040,078 \$3,027,844	\$6,793,881 \$1,577,507	\$19,833,959 \$4,605,350	Necess ary- 2-5 Yrs	Deferred Maintena nce	Most of the terminal units are original and show signs of damage. Some of the terminal units were replaced in approximately 40% of the school classrooms. The school is in need of complete terminal units update. The school engineer stated the units control system is not operating at times and, if operating, the temperature is not adequate.
	D3030	Cooling Generating Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$775,899	\$404,244	\$1,180,143	Necess ary- 2-5 Yrs	Deferred Maintena nce	Window units throughout the school are not code compliant and are outdated. Cooling in the school is poor according to the school engineer. Most of the rooms have control problem and the units are noisy. Roof top units have control problems.
	D3060	Controls & Instrumentation	System	Beyond Useful Life	Renew System	1	Ea.	\$112,482	\$58,603	\$171,086	Necess ary- 2-5 Yrs	Deferred Maintena nce	The roof top units, window units, and unit ventilators control and balancing system has major control and balancing problems. The school engineer indicated that ventilation is poor in many areas. Some rooms are too cold and some are too hot.
	D3070	Systems Testing & Balancing	System	Beyond Useful Life	Renew System	1	Ea.	\$89,527	\$46,643	\$136,170	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	D4010	Sprinklers	System	Beyond Useful Life	Renew System	1	Ea.	\$459,112	\$239,197	\$698,309	Necess ary- 2-5 Yrs	Deferred Maintena nce	The school has functioning sprinkling system in most of the areas. The system is mostly original and may need update or replacement.
	D5010	Electrical Service/Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$204,305	\$106,443	\$310,748	Necess ary- 2-5 Yrs	Deferred Maintena nce	The emergency generator, electrical panels, transformers and other related electrical equipment are mostly original. Although this equipment may function properly most of the time, it is beyond useful life and ready for update.
	D5020	Lighting and Branch Wiring	System	Beyond Useful Life	Renew System	1	Ea.	\$1,602,301	\$834,799	\$2,437,100	Necess ary- 2-5 Yrs	Deferred Maintena nce	The lighting system is partially updated, but some classrooms and offices are in need of update. Many of the light covers are stained and broken. Some classrooms need ballast and wiring.

General Information:

Function:	Middle School
Gross Area:	142,413 S.F.

Year Built:
Last Renovation:**Facility Description:**

Drew Freeman Middle School is a three-story, 142,413 square foot facility located on an 18.4-acre site close to the Suitland Parkway and Interstate 495 (Capital Beltway) in Suitland, MD. The original building was constructed in 1960 and was purchased in 1995. No additions have been constructed.

ACCESSIBILITY ISSUES

Efforts were made to make this multi-story facility handicap assessable. For example, handicap parking spaces were placed near entrances, curb cuts and ramps to the entrance doors were installed, an elevator and two stair lifts were installed, larger toilet stalls with metal handrails were installed, and interior and exterior graphics and/or signage were installed. In addition, push button wall switches and automatic door openers for handicap access were installed on some of the doors, but do not seem to work. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete basement and foundation walls. The building has a basement of cast in place construction. The building also has a crawl space in the basement.

B. SHELL

The superstructure is a combination of steel frame and concrete frame with open web steel joist roof framing. Floor construction appears to be cast-in-place concrete. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU and precast tilt-up concrete panels. Exterior windows are aluminum and steel sash with fixed and operable single-pane glazing. Exterior doors are generally hollow metal steel and solid core wood. Roofing is typically low-slope with built-up roof. The roof over the science rotunda is pitched with single ply membrane.

C. INTERIORS

Interior construction partition wall types typically include painted CMU and glazed block or ceramic tile wainscot in the corridors. Interior doors are generally solid wood doors with hollow metal frames. Interior fittings include chalk and tack boards and toilet partitions, graphics, lockers, toilet accessories, shelving, and handrails. Stair construction includes both concrete and steel risers and treads with terrazzo finishes. Interior wall finishes are typically painted CMU, glazed block, plaster, drywall, and ceramic tile. Floor finishes in common areas is typically terrazzo and vinyl composition tile. Floor finishes in assignable spaces are typically vinyl asbestos tiles, carpet and vinyl composition tile. Floor finishes in the basement are vinyl asbestos tiles and painted concrete. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan Report, that the school contains 24,580 square feet of vinyl asbestos tiles. Ceiling finishes in common areas and assignable areas are typically suspended acoustical panels. The ceiling in the science rotunda is a sprayed on cellulose material.

D. SERVICES**Conveying**

The building includes one hydraulic elevator.

Plumbing

Fixtures include sinks, faucets, urinals, toilets and other plumbing fixtures. Domestic water distribution is approximately 50% copper and 50% galvanized. Sanitary waste system is cast iron. Rain water system is internal and external with roof drains and scuppers. Two new energy efficient boilers, boiler feed system, a new domestic hot water heater, and hot water storage tanks were installed in 2012.

HVAC

Heating is provided by two oil-fired boilers and one small boiler 2012. Cooling is supplied by water cooled chillers, few split systems, and some window units. The heating/cooling distribution system is a ductwork for cooling and 2-pipe for heating system using air handlers, fan coil units, fin tube radiators, VAV boxes, and unit ventilators. Fresh air is supplied by infiltration and air handling units. Ceiling-mounted exhaust fans are installed in bathrooms. Controls and instrumentation are a mix of pneumatic and digital and are not centrally controlled by an energy management system.

Fire Protection

Facility Executive Summary

The building has a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer. Power distribution wiring is typically copper. Lighting and branch wiring is serving recessed, surface-mounted, and pendent-mounted fluorescent and incandescent. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are combined and do not include dedicated closets or cabinets. The building includes an internal security system that is actuated by optical devices and is centrally monitored.

Other Electrical Systems:

The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The kitchen has an exhaust hood with fire suppression. There is fixed audio-visual and laboratory equipment, library, theater and stage, detention, and medical equipment. The building also includes fixed casework, floor grilles, mats, window treatments and multiple seating furnishings. Science room cabinets were planned to be replaced Summer 2012.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site. There is sufficient parking capacity for the occupants where eight out of 260 are handicap spaces and paths to building entrances appear to comply with ADA requirements. There is a 312-space parking lot in the rear of the building that is shared with another building. Landscaping is mature and is not irrigated. Drainage is generally handled by surface discharge and a limited number of area drains. Drainage in the paved areas and is handled by surface discharge and area drains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school has a 15,000 gallon fuel oil tank with level detection that was installed in 2009.

13300 Old Marlboro Pike
Upper Marlboro, MD 20772

eCOMET Facility Report Facility Executive Summary

Report Date: 08 Sep 2012

D2040	Rain Water Drainage	System	Beyond Useful Life	Renew System	1	Ea.	\$118,203	\$61,584	\$179,786	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D2030	Sanitary Waste	System	Beyond Useful Life	Renew System	1	Ea.	\$136,716	\$71,229	\$207,946	Necess ary- 2-5 Yrs	Deferred Maintena nce	Sanitary piping is beyond useful life, outdated, and in some areas is clogged and others leaking.
D3050	Terminal & Package Units	System	Beyond Useful Life	Renew System	1	Ea.	\$1,002,588	\$522,348	\$1,524,936	Necess ary- 2-5 Yrs	Deferred Maintena nce	Almost all of the unit ventilators, air handling units, and other terminal units are original. Some unit vents have bad motors, some have no air coming out of the unit, and some are too noisy. The air handlers have few leaks in the ceiling and in the around the condensation lines because of deteriorating insulation.
D3030	Cooling Generating Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$1,117,942	\$582,448	\$1,700,390	Necess ary- 2-5 Yrs	Deferred Maintena nce	Cooling generation system has few problems and is outdated. Most of the cooling system is original with newer chiller system.
D3040	Distribution Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$1,002,588	\$522,348	\$1,524,936	Necess ary- 2-5 Yrs	Deferred Maintena nce	The heating and cooling distribution system, piping, pumps, ductwork, and fittings, appear to be in poor condition with some of leaks and damage.
D3060	Controls & Instrumentation	System	Beyond Useful Life	Renew System	1	Ea.	\$139,565	\$72,713	\$212,278	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D3070	Systems Testing & Balancing	System	Beyond Useful Life	Renew System	1	Ea.	\$125,323	\$65,294	\$190,617	Necess ary- 2-5 Yrs	Deferred Maintena nce	It was reported that some classrooms get too hot in the winter and too cold in the summer. This indicates that the system testing and balancing is out of order and in need of repair or replacement.
D4010	Sprinklers	System	Beyond Useful Life	Renew System	1	Ea.	\$647,979	\$337,597	\$985,576	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D5010	Electrical Service/Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$281,978	\$146,910	\$428,888	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D5020	Lighting and Branch Wiring	System	Beyond Useful Life	Renew System	1	Ea.	\$2,153,285	\$1,121,861	\$3,275,146	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D5030	Communications and Security	System	Beyond Useful Life	Renew System	1	Ea.	\$400,181	\$208,494	\$608,675	Necess ary- 2-5 Yrs	Deferred Maintena nce	The communication and security systems are mostly original and appear to be inadequate. There are no dedicated closets and wires are scattered around the school.
D5090	Other Electrical Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$9,969	\$5,194	\$15,163	Necess ary- 2-5 Yrs	Deferred Maintena nce	
E1020	Institutional Equipment	System	Beyond Useful Life	Renew System	1	Ea.	\$279,129	\$145,426	\$424,556	Necess ary- 2-5 Yrs	Deferred Maintena nce	
G3060110	NG Supply	System	Beyond Useful Life	Renew System	1	Ea.	\$9,969	\$5,194	\$15,163	Necess ary- 2-5 Yrs	Deferred Maintena nce	Most pumps are original and some are leaking.
G3060110	Propane Tank	System	Beyond Useful Life	Renew System	1	Ea.	\$4,295	\$2,237	\$6,532	Necess ary- 2-5 Yrs	Deferred Maintena nce

Facility Description:

Dwight Eisenhower Middle School is a two-story, 139,951 square foot facility located on a 20.2-acre site close to I-95 and MD Route 295 (Baltimore-Washington Parkway) in Laurel, MD. The original building was constructed in 1969 and an addition was constructed in 1974; no major renovations have been conducted.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. The main entrance does not have an adequate ramp and needs hardware improvements to make it handicap accessible. The school has two chair lifts. Restroom accessibility is minimal. Interior door hardware needs to be improved. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade that is showing minor signs of settlement or damage. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. First floor construction is slab on grade and the second floor and the attic have Tectum board materials with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing was replaced in 2006, is typically pitched in most areas, with built-up roof.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes concrete risers and treads with steel and tile finishes. The interior wall finishes are typically tile and glazed block. Floor finishes in common areas is typically terrazzo, ceramic tile, vinyl composition tile and carpet. Floor finishes in assignable spaces is typically vinyl tile, carpet, wood and ceramic tile. Ceiling finishes in common areas are typically plaster and suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster, suspended acoustical panels, and exposed deck.

D. SERVICES**Conveying**

The building has two chair lifts. One is a stair mounted lift. The other is a vertical lift. These lifts were planned for removal summer 2012.

Plumbing

Most fixtures are original. Domestic water distribution consists of copper and galvanized piping. The hot water system consists of a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains, gutters, and downspouts. The building does not have a sprinkler system, except in mechanical rooms and janitor's closets.

HVAC

Heating is provided by three original steam dual fired boilers that supply fin tube radiators, air handlers and terminal units throughout the building. Cooling is provided two centrifugal chillers with cooling towers. Fresh air is supplied mostly by air handlers and fan coils. Controls are low voltage electrical thermostats and pneumatics. A DDC system was installed in 1998.

Electrical

A pad mounted transformer provides power. Some of the lighting in the corridors has been upgraded, but most corridors and classrooms have 40w fluorescent lamps and hard ballasts. There are battery pack emergency lights in the corridors and exit signs are properly placed and illuminated. The building does not have an emergency generator.

Communication and Security

Facility Executive Summary

The system consists of audible visual/annunciators, manual pull stations, and heat/smoke detectors. The system does not comply with ADA. Telephone and data systems are separate, not located in dedicated closets, and do not have independent cooling systems. The security system consists of motion sensors and CCTV system.

E. EQUIPMENT & FURNISHINGS

Food service equipment was replaced in 2012. The kitchen has an exhaust hood without fire suppression. The grease trap is serviced by building personnel. The building includes fixed library, theater and stage (MPR), audio-visual, laboratory, and medical equipment. The building also includes fixed casework, floor grilles and mats, and multiple seating furnishings, and window treatments.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site where two out of 87 are handicap spaces and path to building entrances does not comply with ADA requirements. Landscaping is not irrigated. Drainage is generally handled by surface discharge. The underground fuel tank lacks leak detection and level control.

Facility Executive Summary

Facility: \Middle Schools\Eugene Burroughs Middle (Accokeek Academy)**Address:** 14400 Berry Road, Accokeek, MD 20607**Attributes:**

School Area	2
Congressional	5
County Council	9
Historical Building	No
Legislative	27A
Original Building	Built in 1963, 87,034 S.F.
School Addition 1	Built in 1965, 11,181 S.F.
School Addition 2	Built in 1976, 28,071 S.F.
School Board District	9
School Grade	6th-8th

General Information:

Function:	Middle School
Gross Area:	126,286 S.F.

Year Built:**Last Renovation:****Facility Description:**

Eugene Burroughs Middle School is a one-story, 126,286 square foot facility located on a 24.1-acre site close to the 210 Freeway in Accokeek, MD. The original building was constructed in 1963 and additions were constructed in 1965 and 1976. A major renovation/addition is underway and is set to complete in 2014. The shell building is to be gutted with build back of all systems with the exception of foundations and bearing walls.

The cost model for this school is based on the available design drawings and planned construction.

Current Repair Cost: \$0.00**Replacement Cost:** \$33,819,766.00**FCI:** 0.00%

Year Built:
Last Renovation:

Facility Description:

G. Gardner Shugart Middle School is a two-story, 100,018 square foot facility located on a 14.8-acre site close to MD Route 5 and Suitland Parkway in Temple Hills, MD. The original building was constructed in 1965 and no additions were constructed or major renovations performed since that time. Replacement and upgrade projects include the boilers in 2007, the roof in 2010, and HVAC controls in 2012.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. Path of travel, exterior and interior access ramps, and vertical conveyance systems within the building are not ADA compliant. In addition, there are no ADA compliant restrooms in the school for either staff or students and fire alarm system is audible with limited strobes. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade and concrete footings and foundation walls. The building does not have a basement, cellar, or sub-floor construction.

B. SHELL

The superstructure is steel frame and load bearing masonry walls. Floor construction is slab on grade and metal pan with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with operable pane glazing. Exterior doors are hollow metal steel. Roofing is typically flat or low-slope with built-up roof. Approximately 40% of the roof was replaced in 2010.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, lockers, toilet accessories, shelving, handrails, and toilet partitions. Stair construction includes steel and concrete risers and treads with terrazzo and tile finishes. Interior wall finishes are typically painted masonry. Floor finishes in common areas are typically terrazzo and vinyl composition tile. Floor finishes in assignable spaces are typically vinyl tile and carpet. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan Report, that the school contains 31,830 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically suspended acoustical tiles. Ceiling finishes in assignable areas are typically suspended acoustical panels and plaster.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Domestic hot water is provided by a gas-fired hot water heater and a pumped recirculation system with two storage tanks. Water service is municipal with combination copper and galvanized service.

HVAC

Heat is provided by two low pressure steam boilers installed in 2007 that provide steam to air handlers, fan/coil units and fin tube radiators throughout the building. There are several electric booster heaters. Cooling is provided by window units. There are roof mounted restroom and building exhaust fans. There is a roof-top HVAC unit serving the office area. Controls are pneumatic and were upgraded in 2012. There are eight exhaust fans serving the gym.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The building is served by a pad-mounted transformer through the original switch gear. Internal wiring is copper, 3-wire/grounded. Lighting is a combination of recessed, surface, and pendant mounted.

Communications and Security

Facility Executive Summary

The fire alarm system consists of audible/strobe annunciators in common and assignable spaces. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are separate and include dedicated closets or cabinets. The building includes an internal security system that is actuated by a combination of devices and is centrally monitored. There are adequate exit lights with battery backup.

Other Electrical Systems

There is no emergency generator.

E. EQUIPMENT & FURNISHINGS

The kitchen has an exhaust hood but no associated fire suppression. The grease trap is serviced by building personnel. The building includes fixed library, theater and stage, audio-visual and medical equipment. The building also includes fixed window treatment furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site. There is insufficient parking capacity for the occupants where three out of 95 are handicap spaces and path to building entrance does not comply with ADA requirements. Landscaping is mature and is not irrigated. Drainage is handled by area drains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The water supply is provided from the campus distribution system. The facility has a 6,000 gallon underground fuel oil tank of dual wall construction and monitoring equipment that was installed in 2009.

Current Repair Cost: \$15,280,392.86**Replacement Cost:** \$26,933,086.77**FCI:** 56.73%

School Grade	6th-8th

General Information:

Function:	Middle School
Gross Area:	129,348 S.F.

Year Built:
Last Renovation:**Facility Description:**

Gwynn Park Middle School is a two-story, 129,348 square foot facility located on a 20-acre site close to MD Route 5 and US Route 301 in Brandywine, MD. The original building was constructed in 1968, with no additions.

ACCESSIBILITY ISSUES

The path to the main entrance has curb cuts and is wide enough for wheel chair access, but the main entrance doors lack push button wall switches and automatic door openers. Handicap toilet stalls are available in only two gang restrooms. Toilet configurations and accessories are inadequate. Interior graphics and/or signage are inadequate and do not comply with ADA requirements. The programs on the second floor are not accessible to the handicap or disabled person. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on a slab-on-grade. The building does not have a basement or a crawl space.

B. SHELL

The superstructure is load bearing masonry walls with slab-on-grade floor and open web steel joist roof framing. The roof is comprised of steel joists. The exterior enclosure is comprised of walls of brick veneer over CMU and vinyl siding. It also includes single panel metal windows with operable frames, and hollow metal steel doors. The exterior is brick veneer and vinyl siding. The metal windows throughout the building are. Most of the classrooms have a fire window exits. Exterior doors throughout the building are original. The building has low-slope, built up roof with gravel ballast. The built-up roof was replaced in 2008.

C. INTERIORS

Interior partition wall types typically include painted CMU with glazed wainscot in the corridors and drywall. Interior doors are generally hollow core wood doors with hollow metal frames. Interior fittings include chalk/tack boards, toilet accessories, handrails, and toilet partitions. Stair construction includes steel risers and treads with terrazzo and VCT finishes in good condition. There is a metal ladder to access the roof hatch.

Interior wall finishes are typically painted CMU and drywall partitions. Floor finishes throughout the building are typically vinyl composition tiles (VCT), vinyl asbestos tiles (VAT), carpet, terrazzo, and ceramic tiles. During the 2008 Assessment it was noted in the A.H.E.R.A. Management Plan Report, the school contains 89,680 square feet of VAT. The overall ceiling finishes are typically suspended acoustical tiles. Also, according to the A.H.E.R.A. Management Plan Report, the school contains 77,950 square feet of asbestos containing fissured ceiling tiles.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Domestic water distribution is generally copper. Sanitary waste system is cast iron. Rain water system is internal with roof drains.

HVAC

Heating is provided by two original gas/oil-fired boilers s. Cooling is supplied by a water cooled chiller. Heating/cooling distribution system is a ductwork system using air handlers and electrical fin tube radiators. Fresh air is supplied by three air handling units. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

Facility Executive Summary

The electrical service is fed from a pad mounted transformer. There are six transformers throughout the building. Power distribution from branch panels wiring is typically copper. Lighting and branch wiring is typically serving mostly recessed fluorescent. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in interior corridors. The system is activated by pull stations in corridors and smoke detectors in corridors and storage, and is centrally monitored. The telephone and data systems are combined and include dedicated closets. The building includes an internal security system that is actuated by contact devices and is said to be centrally monitored.

Other Electrical Systems:

The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The kitchen has an exhaust hood without fire suppression. Grease trap is serviced by building personnel. The building includes fixed library, theater and stage, laboratory, and medical. The library has adequate shelves and the furniture, such as tables/chairs. The nurse's room has two beds. The building also includes fixed casework/cabinetry in the classrooms, window treatment and multiple seating furnishings (folding chairs and tables) in the multi-purpose room.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Asphalt surface parking is available on-site. A new parking surface was constructed in 2005 in front of the school. The road surface is in fair condition with some damage, especially in the lower lot by the gymnasium. The basketball court has a new asphalt surface. There are two reserved handicap spaces out of total 115 parking spaces. The parking surface and curbs were striped in 2007. The bus drop-off zone is at the front entrance, which is not covered. Drainage is handled by surface discharge. The parking lot and site do not flood when it rains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school has an 8,000 gallon underground fuel oil tank that was upgraded in 2007.

Facility Description:

Hyattsville Middle School is a three-story, 119,597 square foot facility located on a 9.8-acre site close to MD Route 295 in Hyattsville, MD. The original building was constructed in 1938 and one addition was constructed in 1973, with no major renovations performed. Structural repairs were made to the addition building in 1997; emergency structural repairs were also made in 2007. Wiring work was conducted in 1998 and interior upgrades were performed in 2006. The roof was replaced in 2011.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements. The study should include ramp access, door hardware, interior signage, restrooms, drinking fountains and elevators.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade, concrete footings, and foundation walls. The building does not have a basement, cellar or sub-floor construction.

B. SHELL

The superstructure is steel frame, with load bearing masonry walls, and sections of reinforced concrete. Floor construction is slab on grade, metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer and precast tilt-up concrete panels. Exterior windows are aluminum sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically pitched asphalt shingle and a low-slope built-up roof, the roof was replaced in 2011. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, toilet partitions. Stair construction includes steel and concrete risers and treads with tile finishes. The interior wall finishes are typically painted CMU. Floor finishes in common areas are typically vinyl composition tile. Floor finishes in assignable spaces are typically vinyl tile in. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically exposed decking.

D. SERVICES

Conveying

Conveying equipment includes one hydraulic elevator that serves three floors in the expansion.

Plumbing

Fixtures were scheduled for a phased replacement at the time of the 2008 assessment. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal and external with roof drains and scuppers. Domestic hot water is provided by gas and oil hot water heaters.

HVAC

Heating is provided by two gas-fired boilers units. Cooling is supplied by one water cooled chiller, which was installed in 1973. The heating/cooling distribution system is a 2-pipe system using unit ventilators. Fresh air is supplied by infiltration. Ceiling mounted exhaust fans are installed in bathrooms, but ventilation is inadequate. Controls and instrumentation are pneumatic and are centrally controlled by an energy management system.

Fire Protection

The building has a limited fire sprinkler system. Standpipes are included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

Facility Executive Summary

The electrical service is fed from a pad mounted transformer that delivers 120/208 square D double ended, 3000 amp switch, 4000 amp buss, 1973 power to a main panel. Power distribution from branch panel wiring is typically copper, 3-wire grounded. Lighting and branch wiring is typically 3-wire grounded serving surface-mounted fluorescent lights. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common and assignable spaces. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are separate and include dedicated closets or cabinets. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems

The building does not have emergency generator. Emergency lighting is provided by battery pack units.

E. EQUIPMENT & FURNISHINGS

The building includes fixed food service, library, theater and stage, audio-visual, laboratory, medical equipment, food service equipment and grease trap. The kitchen has an exhaust hood with no fire suppression. The building also includes window treatment and temporary multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site at two different locations - near the main entrance and near the corner of the property. One handicap space is available out of the 114 parking spaces. There is a path to the building entrance. Landscaping is mature and is not irrigated. Drainage is handled by surface area drains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The water supply is provided from the campus distribution system.

Current Repair Cost: \$17,478,466.31**Replacement Cost:** \$32,189,334.49**FCI:** 54.30%

eCOMET Facility Report

Report Date: 08 Sep 2012

Facility Executive Summary

B2020	Exterior Windows	System	Beyond Useful Life	Renew System	1	Ea.	\$364,771	\$190,046	\$554,816	Necessary- 2-5 Yrs	Deferred Maintenance	Exterior window applications are single pane aluminum applications that are very weathered and worn. The exterior windows are recommended for upgrade to a double-pane aluminum framed application that meet weather tight and energy standards.
B2030	Exterior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$233,214	\$121,505	\$354,719	Necessary- 2-5 Yrs	Deferred Maintenance	Exterior doors were installed in 1973. Most of the doors are in good condition; however, several are damaged and are in poor condition. Universal replacement over the next two to five years is recommended. This project should be phased in stages in order to maintain consistency.
C1030	Fittings	System	Beyond Useful Life	Renew System	1	Ea.	\$345,635	\$180,076	\$525,711	Necessary- 2-5 Yrs	Deferred Maintenance	Most of the fittings are original to the building's construction. Universal upgrades are recommended.
C3010230	Paint	System	Beyond Useful Life	Renew System	1	Ea.	\$540,898	\$281,808	\$822,706	Recommended -3-10 Yrs	Deferred Maintenance	The painted interior finishes are in fair condition and the school appears to be on a cyclical painting program. This project provides a budgetary consideration for a universal interior repainting project within the next ten years.
C3020410	VCT	System	Beyond Useful Life	Renew System	1	Ea.	\$679,761	\$354,155	\$1,033,916	Recommended -3-10 Yrs	Deferred Maintenance	VCT is in good condition; however, considering the high traffic and general use this flooring system is recommended for a universal upgrade within the next ten years.
C3030210	Acoustical Ceilings	System	Beyond Useful Life	Renew System	1	Ea.	\$569,282	\$296,596	\$865,877	Necessary- 2-5 Yrs	Deferred Maintenance	Acoustical ceiling grids are failing at a faster than normal rate in some cases. Tiles are replaced on an as needed basis. To keep up with the consistent replacement of the tile system and provide a consistent ceiling finish, universal upgrades are required. Install new grid and ceiling finish within the next two to five years.
D2010	Plumbing Fixtures	System	Beyond Useful Life	Renew System	1	Ea.	\$963,952	\$502,219	\$1,466,171	Necessary- 2-5 Yrs	Deferred Maintenance	
D2020	Domestic Water Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$68,170	\$35,517	\$103,687	Necessary- 2-5 Yrs	Deferred Maintenance	
D2040	Rain Water Drainage	System	Beyond Useful Life	Renew System	1	Ea.	\$74,150	\$38,632	\$112,782	Necessary- 2-5 Yrs	Deferred Maintenance	
D2030	Sanitary Waste	System	Beyond Useful Life	Renew System	1	Ea.	\$106,441	\$55,456	\$161,897	Necessary- 2-5 Yrs	Deferred Maintenance	
E1020	Institutional Equipment	System	Beyond Useful Life	Renew System	1	Ea.	\$228,430	\$119,012	\$347,442	Necessary- 2-5 Yrs	Deferred Maintenance

Facility Description:

Isaac J. Gourdine Middle School is a two-story, 136,707 square foot facility located on a 16.7-acre site close to Route 210 (Indian Head Highway) and Interstate 495 (Capital Beltway) in Fort Washington, MD. The original building was constructed in 1969 as Lord Baltimore Middle and an addition was constructed in 1992 with no major renovations. Minor renovations included roof 2001 and 2007, boilers/HVAC 2007, interior painting 2005, and asbestos abatement in 2010. Unit ventilators were replaced in 2012.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. There are restrooms in the 1992 addition that consist of compliant lavatories, mirrors, dispensers, and water closets. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building has a sub-floor in the mechanical space of concrete construction.

B. SHELL

The superstructure is steel frame and load bearing masonry walls. Floor construction is slab on grade and metal pan with lightweight fill. Roof construction is flat metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with fixed and operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically flat with built-up roof and PVC single ply membrane. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior partition wall types typically include painted CMU, drywall, and tile. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, toilet partitions. Toilet configurations and accessories do not comply with ADA requirements, with the exception of the restrooms in the 1992 addition. Interior graphics and/or signage do not comply with ADA requirements. Stair construction includes steel risers and treads with tile finishes. The interior wall finishes are typically drywall, tile, and painted CMU. Floor finishes in common areas are typically terrazzo, ceramic tile, vinyl composition tile, and carpet. Floor finishes in assignable spaces are typically vinyl tile. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically 2x2 or 2x4 suspended acoustical panels.

D. SERVICES

Conveying

The building does not include conveying equipment.

Plumbing

Domestic water distribution is copper. The domestic hot water system was replaced in the boiler room in 2007. Sanitary waste system is cast iron. Rain water system is internal with roof drains. There are two minimal handicap accessible toilet rooms for males and females.

HVAC

Heating is provided by two (2007) oil and gas fired steam boilers supplying hot water (hydronic) heat through a heat exchanger, with a two-pipe distribution system to air handlers, unit ventilators, and fan/coil units throughout the facility. There are two heat pumps in each of the classrooms of the 1992 addition. Cooling is supplied by one screw type water cooled refrigeration machine (1998) supplying chilled water to the same two-pipe system with a cooling tower on the roof above the boiler room. There are three rooftop package units serving the multi-purpose room, media center, library, and office areas. Fifty-two unit ventilators (package units) were replaced in 2012. Fresh air is supplied by air handling units. Roof mounted exhaust fans are installed in restrooms and for building. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

Facility Executive Summary

The building does not have a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer. The main switchgear is original. Power distribution from branch panel wiring is typically copper 3-wire grounded. Lighting and branch wiring is typically 3-wire grounded serving recessed, surface-mounted, and pendent-mounted fluorescent. Emergency lighting is battery and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces, interior corridors, etc., and does not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is reported to be centrally monitored. The telephone and data systems are separate and include dedicated closets or cabinets. The building includes an internal security system that is actuated by motion and optical combination devices and is centrally monitored.

Other Electrical Systems:

The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, medical equipment, food service equipment and grease trap interceptor. The building also includes fixed casework and window treatment furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site. There is sufficient parking capacity for the occupants where one out of 66 are handicap spaces and path to building entrance does not comply with ADA requirements. Landscaping is mature and is not irrigated. Drainage is handled by area drains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school has a 8,000 gallon fuel oil tank of dual wall construction with level and leak detection systems that was installed in 2009.

Original Building	Built in 1972, 129,348 S.F.
School Board District	9
School Grade	7th-8th

General Information:

Function:	Middle School
Gross Area:	129,348 S.F.

Year Built:
Last Renovation:**Facility Description:**

James Madison Middle School is a two-story, 129,348 square foot facility located on a 20-acre site close to MD Route 223 and between MD Route 4 and MD Route 4 in Upper Marlboro, MD. The original building was constructed in 1972 and no additions were constructed or major renovations performed since that time. Minor renovations include roof replacement in 1994, boilers in 2004, and exterior and interior painting in 2010.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. The access ramp to the main entrance appears to be too narrow and too steep and lacks change in texture and color, and exterior and interior door hardware is not ADA compliant. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade on the first floor and metal pan with lightweight fill on the first floor. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Roofing is typically pitched with built-up roof and standing seam metal.

C. INTERIORS

Interior partition wall types typically include painted CMU and glazed blocks. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Toilet configurations do not appear to comply with ADA requirements. Interior graphics and signage do not appear to comply with ADA requirements. Stair construction includes concrete risers and treads with steel and terrazzo finishes. The interior wall finishes are typically painted CMU, glazed blocks, and ceramic tiles. Floor finishes in common areas are typically terrazzo, ceramic tile and, vinyl composition tiles. Floor finishes in assignable spaces include vinyl tile, carpet, wood, terrazzo and VAT resilient tiles. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 45,200 square feet of 12x12 vinyl asbestos tiles. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster, 2x2 or 2x4 suspended acoustical panels, and exposed deck.

D. SERVICES**Conveying**

The building has a limited use hydraulic elevator.

Plumbing

Fixtures are original. Low flow toilets were installed in 2007. Domestic water distribution is original and consists of copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building does not have a sprinkler system.

HVAC

Heating is provided by two steam, dual fired boilers that supply multi-zone air handlers and terminal units throughout the building. Cooling is provided by a screw chiller with cooling tower located behind the building. Distribution is by a two pipe system to multi-zone air handlers and terminal units. Fresh air is supplied mostly by outdoor air ducted to the air handler units. Controls are low voltage electrical thermostats and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to a 2200 amp main disconnect. Minor circuit additions have been installed when the chiller was replaced and to address computer needs, but most of the system is original. Lighting has been upgraded to electronic ballasts and T-8 lamps. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a new 150 KW emergency generator.

Facility Executive Summary

Communication and Security

The system consists of audible/visual annunciators, manual pull stations, and heat/smoke detectors. The system was upgraded in 1991 and complies with most ADA and life safety requirements. Telephone and data systems are located in an electrical closet. The security system consists of motion sensors and a CCTV system.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage (MPR), audio-visual, laboratory, medical equipment, food service equipment and grease trap interceptor. The building also includes fixed casework, floor grilles and mats, furnishings and window treatments.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site. Parking lot improvements were made in 2012 to increase the number of spaces and improve the parking lot conditions. Landscaping is sparse and is not irrigated. Drainage is generally handled by surface discharge. A new fuel tank with leak detection and level indication was installed in 2004.

Current Repair Cost: \$21,009,421.39**Replacement Cost:** \$34,846,877.18**FCI:** 60.29%

Original Building	Built in 1973, 128,381 S.F.
School Board District	4
School Grade	6th-8th

General Information:

Function:	Middle School
Gross Area:	128,381 S.F.

Year Built:
Last Renovation:

Facility Description:

Kenmoor Middle School is a two-story, 128,381 square foot facility located on a 24.5-acre site close to MD Route 295 (Baltimore-Washington Parkway) and US Route 50 in Landover, MD. The original building was constructed in 1973 and no additions have been constructed or major renovations performed. Minor renovations included boiler replacement in 2002, roof replacement in 2011, and unit ventilator replacement in 2012.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. Ramp to the main entrance and main entrance hardware needs to be improved. Interior door hardware, toilet configurations, graphics and signage need to be improved as well. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade on the first floor and metal pan with lightweight fill on the second floor. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically low-slope with built-up roof and was replaced in 2011.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally a combination of solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, lockers, shelving, and toilet partitions. Stair construction includes concrete risers and treads with steel and tile finishes. The interior wall finishes are typically tile and glazed block. Floor finishes in common areas are typically terrazzo, ceramic tile, vinyl composition tile, vinyl asbestos tiles, and carpet. Floor finishes in assignable spaces are typically vinyl composition tile, vinyl asbestos tile, carpet and wood. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan Report, that the school contains 27,300 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster and suspended acoustical panels.

D. SERVICES

Conveying

The building has two elevators.

Plumbing

Fixtures are original. Domestic water distribution is original and consists of copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron in. Rain water drain system is internal with roof drains. The building has a sprinkler system.

HVAC

Heating is provided by two steam dual fired boilers that supply air handlers, fan coils, fin tube radiators, and terminal units throughout the building from steam/water heat exchangers. Cooling is provided by a steam fed absorber, roof mounted cooling tower, roof mounted cooling only package units and an air cooled split system. Distribution is by 2-pipe system and metal duct work and unit ventilators that were replaced in 2012. Fresh air is supplied by air handlers and infiltration. Controls are low voltage electrical thermostats and pneumatics. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to a 3000 amp main disconnect. Most of the electrical distribution system is original. Lighting has not been upgraded. There are battery pack emergency lights in the corridors and exit signs are properly placed and illuminated. The building does not have an emergency generator.

Facility Executive Summary

Communication and Security

The system consists of visual/audible annunciators, manual pull stations and heat/smoke detectors. The system does not comply with ADA or life safety requirements. Telephone and data systems are separate, not located in dedicated closets. The security system consists of motion sensors and a limited coverage CCTV system.

E. EQUIPMENT & FURNISHINGS

The kitchen has an exhaust hood without fire suppression. The grease trap is serviced by building personnel. Some food service equipment was replaced/installed in 2012. The building also includes fixed library, theater and stage (MPR), laboratory, and medical equipment. The building also includes fixed casework, floor grilles and mats, and multiple seating furnishings and window treatments.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site. Four out of 128 are handicap spaces and paths to building entrances do not comply with ADA requirements. Drainage is generally handled by surface discharge. The underground fuel tank was replaced in 2002.

School Board District	6
School Grade	6th-8th

General Information:

Function:	Middle School
Gross Area:	120,800 S.F.

Year Built:
Last Renovation:

Facility Description:

Kettering Middle School is a one-story, 120,800 square foot facility located on a 20-acre site close to MD Route 214 and I-495 (Capital Beltway) in Upper Marlboro, MD. The original building was constructed in 1977 and an addition was constructed in 1992 (Eight Modulares), with no major renovation. Minor renovations included roof replacement in 2001, boiler/HVAC in 2007, door replacement in 2008, interior painting in 2009, and exterior repaint/re-glaze in 2010.

ACCESSIBILITY ISSUES

The main entrance has curb cuts and wide enough doors, but lacks have push button wall switches / automatic door openers. All the programs in this one-story facility are handicap accessible. Handicap stalls in the restrooms are adequate. Toilet configurations and accessories appear to comply with ADA Accessibility Guidelines (restrooms do not have doors). Interior graphics and/or signage are inadequate or missing and do not comply with ADA requirements. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, sub-floor, or crawl space.

B. SHELL

The superstructure is load bearing masonry walls. Roof construction is metal pan with lightweight fill. The exterior enclosure is brick veneer over CMU. The exterior walls have metal panels in the courtyard. The exterior windows in the original building are aluminum sash with operable single-pane glazing Plexiglas. The exterior windows in the 1992 addition are aluminum sash with operable thermo pane glazing. Most of the classrooms do not have fire window exits. Two classrooms have an exterior door. The exterior doors in the original building are hollow metal steel. There are metal exterior doors in the 1992 addition. Roofing on the original building is typically low-slope with built-up roof with gravel ballast was replaced in 2001. Roofing on the 1992 addition is single ply rubber membrane.

C. INTERIORS

The interior partition wall types typically include painted CMU and folding metal partition walls (in multi-purpose room and classroom pods). The interior doors, including fire doors with 20 minute fire ratings, are generally solid core wood doors with hollow metal frames.

Interior fittings include chalk/tack boards, lockers, toilet accessories, handrails, and toilet partitions. Most of the classrooms have original blackboards with an exception of few classrooms which have new white boards. Toilet accessories such as metal toilet partitions are original. The facility does not have stair construction. There is a metal ladder to access the roof hatch.

Interior wall finishes are typically painted CMU walls and folding metal partitions. Interior was repainted in 2009. Floor finishes throughout the building are typically 12x12 vinyl composition tiles (VCT), carpet, and ceramic tiles. Ceiling finishes are typically suspended 1x1, 2x2, or 2x4 acoustical tiles.

D. SERVICES

Conveying

The building does not have an elevator.

Plumbing

Fixtures are original. Domestic water distribution is original and consists of copper and galvanized piping. Domestic hot water is provided by an oil fired water heater with an electric booster heater for the kitchen. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building has a sprinkler system.

HVAC

Facility Executive Summary

Heating is provided by two steam, dual fired boilers that supply fin tube radiators and terminal units throughout the building. Heating and cooling was upgraded with gas fired roof mounted package units for classrooms in 2007. Heating and cooling in the modular addition is provided by heat pumps with supplemental strip heat. DX split systems cool some administrative and common use areas. Distribution is a 2-pipe system to fin tube radiators and terminal units with metal duct from package units to individual spaces. Fresh air is supplied by the roof mounted package units. Controls are low voltage electrical thermostats and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to a 2000 amp main disconnect. Upgrades were done with the addition of the roof mounted package units, but most of the distribution system is original. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a 20 Kw emergency generator.

Communication and Security

The system in the main building consists of audible annunciators, manual pull stations, and heat/smoke detectors. The system does not comply with ADA or life safety requirements. The system in the addition generally meets ADA requirements. Telephone and data systems are separate, not located in dedicated closets. The security system consists of motion sensors and a limited CCTV system.

E. EQUIPMENT & FURNISHINGS

The kitchen has an exhaust hood without fire suppression. The grease trap is serviced by building personnel. The building also includes fixed library, theater and stage, and medical equipment. The library has shelves and furniture, such as tables/chairs. The nurse's room has three beds in both boys and girls rooms. The school has a stage with lights and curtains. The building also includes fixed casework/cabinetry in few classrooms, window treatment, and multiple seating furnishings (folding chairs and tables) in multipurpose room.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Asphalt surface parking is available on-site. There are four reserved handicap spaces out of total 114 parking spaces. The bus drop-off zone at the front entrance is not covered. Drainage is handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic.

Original Building	Built in 1972, 127,516 S.F.
School Board District	1
School Grade	7th-8th

General Information:

Function: Middle School
Gross Area: 127,516 S.F.

Year Built:
Last Renovation:

Facility Description:

Martin L. King Middle School is a two-story, 127,516 square foot facility located on a 20-acre site close to I-95 in Beltsville, MD. The original building was constructed in 1972 with no additions constructed since that time. A POD conversion project was executed as part of FY2009 (10,184 S.F.). Minor renovations included interior painting in 2005 and replacing lockers in 2008.

ACCESSIBILITY ISSUES

The main entrance has curb cuts, but lacks push button wall switches and automatic door openers. Handicap stalls are missing in the gang restrooms on both floors. The toilet configurations and accessories are inadequate for the handicapped. Interior graphics and/or signage for ADA compliance are inadequate and missing in the building (only parking areas have handicap signs). The facility is two stories and has no elevator, but does have a portable wheel chair lift, which is not considered safe. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footing and foundation walls. The building does not have a basement, but does have a crawl space.

B. SHELL

The superstructure is load bearing masonry. The roof construction is metal pan with lightweight fill and is resting on open web steel joist roof framing. The exterior enclosure is brick veneer over. There are very few windows in the facility. The exterior windows are typically aluminum sash with fixed single-pane glazing. The exterior doors are hollow metal steel. The facility has low-slope, built up roof with gravel ballast. The built-up roof was replaced in 1999.

C. INTERIORS

The interior partition walls typically include painted CMU and drywall. The interior doors, including fire doors with no fire ratings, are generally solid core wood doors with hollow metal frames. Interior fittings include chalk/tack boards, lockers toilet accessories, handrails, and toilet partitions. The lockers in the corridors were replaced in 2008. Toilet accessories, such as metal toilet partitions are original. The facility has concrete stairs with concrete risers/treads. There is a metal ladder to access the roof hatch.

The interior wall finishes are typically painted CMU and drywall. The floor finishes throughout the building are typically 12x12 vinyl composition tiles (VCT) and vinyl asbestos tiles, terrazzo, carpet, and ceramic tiles. There are 12x12 VCT floor finishes in the library, multi-purpose room, and corridors. There is wood parquet flooring in the gym and stage area. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 67,000 square feet of 12x12 vinyl asbestos tiles. The overall ceiling finishes are typically suspended 2x2 acoustical tiles.

D. SERVICES**Conveying**

The building does not include fixed conveying equipment. There is a portable stair-climbing chair for handicap use.

Plumbing

Fixtures are original. Domestic water distribution is copper and galvanized steel. There are no ADA compliant facilities; however, some gang restrooms have handicap accessible stalls. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by an gas hot water heater, which was installed in 2002.

HVAC

Heating is provided by two steam boilers, oil and gas fired, which were installed in 2005. All boiler room ancillary equipment was updated between 2003 and 2005. Cooling is supplied by a rotary water cooled chiller, which was installed in 2002. The heating/cooling distribution system is provided by 15 penthouse air handler ductwork and 4-pipe system using fan coils and unit ventilators. Fresh air is supplied by air handling units. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are hybrid and are centrally controlled by an energy management system.

Fire Protection

The building has a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Facility Executive Summary

Electrical

The electrical service is fed from a pad mounted transformer. Main switchgear, was installed in 2000. Power distribution from branch panels wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded serving recessed, surface-mounted, and pendent-mounted fluorescent and some incandescent. Emergency power and lighting are battery powered present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors, etc., and do not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are separate and do not include dedicated closets or cabinets. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, medical equipment, food service equipment and two grease trap interceptors. The library has shelves and furniture, such as tables and chairs. The nurse's room has two beds in both boys and girls rooms. The building also includes fixed casework/cabinetry in the classrooms, window treatment, and multiple seating furnishings (folding chairs and tables) in the multi-purpose room.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

There are four reserved handicap spaces out of total about 129 parking spaces. There is sufficient parking capacity for the occupants. Drainage is handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. There is partial fencing around the site or athletic fields. Buses access the main entrance through driveway, which is not covered. The facility has a 10,000 gallon fuel tank that was installed in 2004, of dual-wall construction, and has monitoring equipment.

School Grade	6th-8th

General Information:

Function:	Middle School
Gross Area:	105,697 S.F.

Year Built:**Last Renovation:****Facility Description:**

Nicholas Orem Middle School is a two-story, 105,697 square foot facility located on a 16.368-acre site close MD Route 410 in Hyattsville, MD. The original building was constructed in 1962, with additions constructed in 1989 and 1993, and no major renovations performed, with exception of FY06 CF Lockers, roof replacement 2008, Fire safety upgrades 2008, and the kitchen hood in 2007.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements. The study should include access ramps, door hardware, interior signage, restrooms, drinking fountains, fire alarm, and elevators.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade with concrete footings and foundation walls. The building has a crawl space of CMU construction.

B. SHELL

The superstructure is concrete reinforced masonry with face brick, load bearing CMU walls. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill on built up roof system. The exterior enclosure is comprised of walls of brick veneer over CMU. Windows are aluminum sash with operable single-pane glazing. Exterior doors are hollow metal steel with hollow metal frames. Interior doors are solid core wood with hollow metal frames. The doors do not have fire labels. Roofing is typically low-slope with built-up roof, 95,329 sq. ft was replaced in 2008.

C. INTERIORS

Interior partition wall types typically include painted CMU and glazed block. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, toilet partitions. Toilet configurations and accessories comply with ADA requirements. Interior graphics and signage do not comply with ADA requirements. Stair construction includes concrete risers and treads with tile finishes. The interior wall finishes are typically painted CMU and glazed block. Floor finishes in common areas are typically asbestos tile, ceramic tile, and wood in the gym. Floor finishes in assignable spaces is typically asbestos tile and carpet. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 39,200 square feet of 9x9 vinyl asbestos tiles. Ceiling finishes in common areas are typically 2x2 suspended acoustical tile and 2x4 suspended Tectum panels on ground level. Ceiling finishes in assignable areas are typically 2x2 suspended acoustical tile and 2x4 suspended Tectum panels.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

The plumbing fixtures in about one-half of the school were replaced in 2007. The balances of the fixtures are much older. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by a gas fired hot water generator, and two remote, approximately 100 gallon storage tanks.

HVAC

Heating is provided by two oil-fired boilers. Cooling is supplied by window units. The heating distribution system is a 2-pipe system to unit ventilators. Ceiling-mounted exhaust grilles are installed in restrooms to roof mounted exhaust fans. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are, distributed near fire exits and corridors.

Electrical

Facility Executive Summary

The electrical service is fed from an underground vaulted utility transformer. Power distribution wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded. Lighting is typically 2x2 fluorescent lay-in troffers in the corridors and 1x4 surface wrap-around units in the classrooms. The school lighting underwent a T-8 lamp and ballast change-out in 2007. The exterior parking and roadway lighting consists of bracket arm mounted cobra head HID luminaires on aluminum poles and square concrete bases. Emergency power lighting is present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible signal devices in common spaces, interior corridors, etc. and does not comply with ADA requirements. The fire alarm control panel was upgraded in 2008. The telephone and data systems are separate and include dedicated closets or cabinets. The building includes an internal security system that is actuated by contact, optical or combination devices and is centrally monitored.

Other Electrical Systems: The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, medical equipment, food service equipment and grease trap interceptor. The building also includes fixed casework, window treatments, floor grilles and mats, and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site. There is sufficient parking capacity for the occupants where three out of 117 are handicap spaces and paths to building entrances appear to comply with ADA requirements. Landscaping is indigenous and is not irrigated. Drainage handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school has a 15,000 gallon underground fuel oil tank that was installed in 1990.

Current Repair Cost: \$11,740,962.92

Replacement Cost: \$27,134,528.86

FCI: 43.27%

Gross Area:	106,801 S.F.

Year Built:
Last Renovation:**Facility Description:**

Oxon Hill Middle School is a 106,801 square foot facility located on a 21.3-acre site close to Route 210 (Indian Head Highway) in Fort Washington, MD. The facility was constructed in 1972 and has no additions and no major renovations with the exception of the chimney which was replaced in 2010 and a large portion of the roof that was replaced in 2012. The facility consists of two buildings, a one story building, which includes a gymnasium, cafeteria administrative area and classrooms, and a two story building, which includes a library, classrooms and science labs. The two buildings are connected by a long corridor and a covered exterior walkway.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls. The building does not have a basement, but does have a crawl space of CMU construction.

B. SHELL

The superstructure is steel and concrete frame. Floor construction is metal pan with lightweight fill. Roof construction is Tectum roof deck. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel in. Roofing is pitched on the two-story building in the back and low-slope on the one-story building in the front. More than half of the roof was replaced in 2012. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior construction partition wall types typically include painted CMU, glazed block wainscot in the corridors, and drywall. Interior doors are generally solid core wood doors and fire doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, and toilet partitions. Toilet configurations and accessories do not comply with ADA requirements. Interior graphics and/or signage do not comply with ADA requirements. Stair construction includes concrete risers and treads with concrete finishes. The interior wall finishes are typically painted CMU, painted drywall and exposed brick. Floor finishes in common areas is typically terrazzo and vinyl composition tile. Floor finishes in assignable spaces is typically vinyl composition tile and carpet. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 67,350 square feet of 12x12 vinyl asbestos tiles. Ceiling finishes in common areas are typically 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically 2x4 suspended acoustical panels, plaster, and drywall.

D. SERVICES**Conveying**

The building includes one elevator.

Plumbing

Urinals, toilets, and flush valves were installed in 2007. Sinks, faucets, and other plumbing fixtures are original. Most of the water fountains are original. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is a combination of internal and external with roof drains. Domestic hot water is provided by gas hot water heaters scattered throughout of the school and one is located in the boiler room.

HVAC

Heating is provided by three gas/oil boilers, which were installed in 1971. Cooling is supplied by a combination of window units and water cooled chiller. The water cooled chiller serves approximately 25% of the building; the office area, multipurpose room, teachers lounge, and classrooms 5, 6, and 7. The remaining 75% is cooled by window units. The heating/cooling distribution system is a ductwork and 2-pipe system using unit ventilators and air handlers. Fresh air is supplied by infiltration and air handling units. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Facility Executive Summary

Fire Protection

The building has a fire sprinkler system. Standpipes are included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer. Power distribution wiring is typically copper 3-wire grounded and is adequate. Lighting and branch wiring is typically 3-wire grounded serving recessed, surface-mounted, and pendant-mounted fluorescent and incandescent. Illumination was installed 2007. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in common spaces, balconies, and interior corridors, and does not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are combined and do not include dedicated closets or cabinets. The building includes an internal security system that is actuated by optical and motion detector devices and is centrally monitored.

Other Electrical Systems: The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, detention, laboratory, medical equipment, food service equipment and two kitchen grease traps. The building also includes fixed casework, window treatment, floor grilles and mats and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site. There is sufficient parking capacity for the occupants where four out of 90 are handicap spaces and path to building entrance does not comply with ADA requirements. Additional unmarked parking is located near the gymnasium. Landscaping is mature and is not irrigated. Drainage is handled by area drains. Concrete sidewalks are immediately adjacent to the facility. There appears to be adequate site lighting for vehicular and pedestrian night traffic, except for the left-rear side of the building, near the gymnasium. The school has a 8,000 gallon fuel oil tank that was installed in 2008.

Current Repair Cost: \$16,538,030.57**Replacement Cost:** \$28,835,322.64**FCI:** 57.35%

Function: Middle School
Gross Area: 133,631 S.F.

Year Built:
Last Renovation:

Facility Description:

Samuel Ogle Middle School is a two-story, 133,631 square foot facility located on a 9.4-acre close to MD Route 197 and MD Route 564 in Bowie, MD. The original building was constructed in 1967 and no additions were constructed. Minor renovations were performed in 2007 and 2012; unit ventilators were also replaced in 2012. The building was converted from an elementary school to a middle school in 2005.

ACCESSIBILITY ISSUES

Efforts to make the facility compliant with ADA requirements were observed. Entrance ramp to the main entrance has a change in texture, a chair lift has been installed at one stair case, and there is vertical chair lift in the building. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade on the first floor and metal pan with lightweight fill on the second floor. Roof construction is metal pan with lightweight fill. The roof was replaced in 1999. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is a combination of pitched and low-slope with built-up roof, standing seam metal.

C. INTERIORS

Interior partition wall types typically include painted CMU and glazed blocks. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Interior wall finishes are typically glazed blocks, tiles, and paint. Floor finishes in common areas is typically terrazzo, ceramic tiles, and VAT resilient tiles. Floor finishes in assignable spaces is typically vinyl tile, VAT resilient tiles, and wood. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster, 1x1 glued acoustical tile, 2x2 or 2x4 suspended acoustical panels and exposed deck. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that asbestos is present in almost all floor tiles and ceiling tiles. Other areas include fire doors, hot water pipe insulation and air handling unit cover.

D. SERVICES

Conveying

The building has a vertical chair. There is also a stairway chair lift.

Plumbing

Fixtures are original. Domestic water distribution is original and consists of copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains, gutters and downspouts. The building does not have a sprinkler system, except in mechanical rooms and janitor's closets.

HVAC

Heating is provided by two steam, oil fired boilers (replaced in 2008) that supply fin tube radiators, air handlers and terminal units throughout the building. Cooling is provided by individual window units for each classroom and centrifugal chiller with a cooling tower for the cafeteria and main office. The chiller was installed in 2005. Fresh air is supplied mostly by air handlers and fan coils during heating and by infiltration in cooling season. Unit ventilators were replaced in 2012. Controls are low voltage electrical thermostats, individual controls on window units and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to the main disconnect that was upgraded in 1998. Lighting in a couple of the classrooms has been upgraded. There are battery pack emergency lights in the corridors and exit signs are properly placed and illuminated. The building does not have an emergency generator.

Communication and Security

Facility Executive Summary

The system consists of audible annunciators, manual pull stations and heat/smoke detectors. The system does not comply with ADA or life safety requirements. Kitchen range hood lacks a fire suppression system. Telephone and data systems are separate, not located in dedicated closets. The security system consists of motion sensors.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage (MPR), audio-visual, laboratory, medical equipment, food service equipment and a grease trap interceptor. The building also includes fixed casework, floor grilles and window treatments.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site. Four out of 96 are handicap spaces and paths to building entrances. Landscaping is not irrigated. Drainage is generally handled by surface drainage. The fuel oil tank was replaced in 1998 and includes leak detector and level indication.

Current Repair Cost: \$22,736,077.84**Replacement Cost:** \$35,947,353.55**FCI:** 63.25%

School Board District	9
School Grade	6th-8th

General Information:

Function: Middle School
Gross Area: 120,070 S.F.

Year Built:
Last Renovation:

Facility Description:

Stephen Decatur Middle School is a one-story, 120,070 square foot facility located on a 16.4-acre site close to MD Route 5 in Clinton, MD. The original building was constructed in 1971, an addition was constructed in 1994 (Six Modulares), and a POD Conversion (10,687 S.F.) was conducted as part of FY2011.

This school is part of the Special Education Inclusion Initiative. A new building addition (approximately 24,000 to 27,000 S.F.) and potential renovation of adjacent space are currently being programmed for a 2014 construction completion that will incorporate the special education program requirements. A parking lot extension or expansion will also be included to support the additional staff.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. The main entrance door has ramp and is wide enough for wheel chair access, but lacks push button wall switches and automatic door openers. Handicap toilet stalls are available in two gang restrooms, for both men and women. However, toilet configurations and accessories are inadequate and interior graphics and/or signage are inadequate and do not comply with ADA requirements. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements. ADA upgrades are currently planned.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, sub-floor, or crawl space.

B. SHELL

The superstructure is load bearing concrete masonry walls with slab-on-grade floor and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over CMU, single panel metal windows with operable frames, and hollow metal steel doors. The metal windows throughout the building are original. Exterior doors throughout the building are original. There are two exterior doors in the gymnasium, which were replaced in 2007. The roof was replaced in 2008.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors, folding metal partitions, and drywall. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk/tack boards, lockers, toilet accessories, handrails, and toilet partitions. The facility does not have stair construction. A steel ladder is available in storage room for access to the roof hatch.

Interior wall finishes are typically painted CMU, folding metal panels, and drywall. The floor finishes are typically carpet and 12x12 vinyl composition tiles in corridors and classrooms. The six classrooms added in 1994 have carpet on the floors, where as the original building mostly has vinyl composition tiles in classroom floors. The vinyl composition tiles in the teachers lounge and a portion of office, where replaced in 2007. The carpet in the office area and teachers lounge was installed in 2007. The floor finishes in restrooms are typically ceramic tiles. The overall ceiling finishes are typically 2x2 or 2x4 suspended acoustical panels. The kitchen and locker rooms have drywall ceilings.

D. SERVICES

Conveying

The building includes a chair lift for the auditorium stage, which was installed in 1997.

Plumbing

New toilets and flush valves were installed in 2007. Domestic water distribution is copper/galvanized steel. Sanitary waste system is cast iron and. Rain water system is internal with roof drains. The roof was replaced in 2007.

HVAC

Heating and cooling is provided by gas-fired rooftop package units. The new addition has six carrier roof-top units, which were installed in 1995. The heating/cooling distribution system is a ductwork system. Fresh air is supplied by air handling units. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

Facility Executive Summary

The building has a fire protection system consisting of smoke detectors in the classrooms and corridors of the new addition. The building is sprinkled except for the gym. Fire extinguishers and cabinets are in kitchen and distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer. There are seven transformers throughout the building on pads. Power distribution from branch panels wiring is typically copper. Lighting and branch wiring is typically 3-wire grounded serving recessed fluorescents. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in interior corridors and does not to comply with ADA requirements. The 1994 addition appears to comply with ADA requirements. The system is activated by pull stations with no smoke detectors and is centrally monitored. The telephone and data systems are separate and are located in dedicated closets or cabinets. The building includes an internal security system that is actuated by contact devices and is centrally monitored. A door-contact type security system with motion detectors and 16 security cameras is present and operational.

Other Electrical Systems: The gas-fired emergency generator with 20 kW was installed in 1970.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, darkroom, audio-visual room, theater and stage, laboratory, medical equipment, food service equipment and grease trap interceptor. The library has adequate shelving and adequate tables and chairs. The darkroom and audio-visual rooms are used as storage rooms. The stage is equipped with a new handicap chair lift. The building also includes fixed casework/cabinetry, window treatment, and multiple seating furnishings (multi-purpose room).

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Asphalt surface parking is available on-site. There are five handicap spaces out of total 95 parking spaces and nine bus loading areas. The path (ramp) to the building entrance appears to comply with ADA requirements. Parking was striped in 2007. Drainage is handled by surface discharge. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic.

Current Repair Cost: \$19,708,674.07

Replacement Cost: \$33,851,793.16

School Board District	4
School Grade	7th-8th

General Information:

Function:	Middle School
Gross Area:	133,631 S.F.

Year Built:
Last Renovation:

Facility Description:

Thomas Johnson Middle School is a two-story, 133,631 square foot facility located on a 13.7-acre site close to I-495 (Capital Beltway) in Lanham, MD. The original building was constructed in 1968 and no additions have been constructed or major renovations performed since that time.

ACCESSIBILITY ISSUES

Efforts have been made to make the facility handicap accessible. Ramps leading to entrances are in place, although they appear to lack change of texture and color, and they appear to be too narrow and too steep. In addition, chair lifts to access the second floor are in place and a few restrooms appear to be handicap accessible. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. First floor construction is slab on grade and the second floor and attic have metal pan with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal. Roofing in most areas is typically pitched with built-up roof. The roof was replaced in 2001.

C. INTERIORS

Interior partition walls are typically painted CMU. Interior doors are generally solid core wood doors with hollow metal. Interior fittings include chalk and tack boards, lockers, toilet accessories, shelving, and toilet partitions. Toilet configurations and accessories appear to partially comply with ADA requirements. Interior graphics and signage appear to partially comply with ADA requirements as well. Stair construction includes concrete risers and treads with steel and tile finishes. Interior wall finishes are typically tile and glazed block. Floor finishes in common areas are typically terrazzo, ceramic tile, vinyl composition tile, carpet, wood (gym floor), and vinyl asbestos tile. Floor finishes in assignable spaces are typically vinyl tile, carpet and vinyl asbestos tile. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 74,000 square feet of 9x9 vinyl asbestos tiles and 3,400 square feet of 12x12 vinyl asbestos tiles. Ceiling finishes in common areas are typically plaster and 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster and 2x4 suspended acoustical panels. Also according to the A.H.E.R.A. Management Plan, the school contains 90,880 square feet of asbestos-containing fissured ceiling and 8,540 square feet of asbestos containing sprayed-on insulation.

D. SERVICES

Conveying

The building has a chair lift.

Plumbing

Fixtures are original. Domestic water distribution consists of copper and galvanized piping. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains, gutters, and downspouts. The building does not have a sprinkler system, except in mechanical rooms and janitor's closets.

HVAC

Heating is provided by three original oil fired steam boilers that supply fin tube radiators, air handlers, and terminal units throughout the building. Cooling is provided by individual window units for each classroom and a centrifugal chiller with a cooling tower for the cafeteria and main office from mezzanine air handlers. Fresh air is supplied mostly by air handlers and fan coils during heating and by infiltration in cooling season. Controls are low voltage electrical thermostats, individual controls on window units and pneumatic. The system is not centrally monitored or controlled.

Electrical

Facility Executive Summary

Power is supplied by a pad mounted transformer. A 2000 amp main disconnect was upgraded in 1998. Lighting in one of the corridors has been upgraded but most corridors and classrooms have 40w fluorescent lamps and hard ballasts. There are battery pack emergency lights in the corridors and exit signs are properly placed and illuminated. The building does not have an emergency generator.

Communication and Security

The system consists of audible annunciators, manual pull stations, and heat/smoke detectors. The system does not comply with ADA or life safety requirements. Telephone and data systems are separate. The security system consists of motion sensors and a CCTV system.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage (Multipurpose Room), audio-visual, laboratory, medical equipment, food service equipment and grease trap interceptor. The building also includes fixed casework and floor grilles, mats and window treatments.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site. A parking lot expansion was completed in 2012 to provide an additional 34 spaces. Landscaping is not irrigated. Drainage is generally handled by surface discharge. There are concrete sidewalks and site lighting. The fuel oil tank was replaced in 2006 and includes leak detector and level indication.

Facility Executive Summary**Facility:** \Middle Schools\Thurgood G. Marshall Middle**Address:** 4909 Brinkley Road, Temple Hills, MD 20748**Attributes:**

School Area	TA
Congressional	4
County Council	8
Historical Building	No
Legislative	26
Original Building	Built in 1962, 102,471 S.F.
School Addition 1	Built in 1964, 7,977 S.F.
School Addition 2	Built in 1965, 9,744 S.F.
School Board District	8
School Grade	6th-8th

General Information:

Function:	Middle School
Gross Area:	120,192 S.F.

Year Built:**Last Renovation:****Facility Description:**

Thurgood Marshall Middle School is a two-story, 120,192 square foot facility located on a 20-acre site close to Interstate 495 (Capital Beltway) and MD 5 in Temple Hills, MD. The original building was constructed in 1962 and additions were constructed in 1964 and 1965 with no major renovation. Unit ventilators were replaced in 2012.

ACCESSIBILITY ISSUES

There are handicap access ramps to the building, but no ramps or elevators within the building. Handicapped students and staff currently exit the building and reenter through other doors in order to access the two levels within the building, the upper level where the cafeteria, choir, library, classrooms and gymnasium are located, and the lower level where the science labs and other classrooms are located. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on a slab-on-grade. The building has a sub-floor of CMU construction.

B. SHELL

The superstructure is steel frame. Floor construction is metal pan with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of pre-cast tilt-up concrete panels and brick. Exterior windows are aluminum or steel sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically low-slope with built-up roof. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior partition wall types typically include painted CMU with glazed block wainscot in the corridors. Interior doors are generally solid core wood doors and composite core fire doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, and toilet partitions. Toilet configurations and accessories do not comply with ADA requirements. Interior graphics and/or signage do not comply with ADA requirements. Stair construction includes steel risers and treads with tile finishes, and is in good condition. Interior wall finishes are typically painted CMU and drywall and ceramic tiles. Floor finishes in common areas are typically terrazzo with some carpet. Floor finishes in assignable spaces are typically vinyl tile, carpet (library), wood (gymnasium), and painted concrete (boiler room). During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 48,000 square feet of 9x9 vinyl asbestos tile and 850 square feet of 12x12 vinyl asbestos tile. Ceiling finishes in common areas are typically 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically 2x4 suspended acoustical panels, drywall, and plaster.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Domestic water distribution is a mixture of copper and galvanized. Sanitary waste system is cast iron. Rain water system is a combination of internal and external with roof drains. Domestic hot water is provided by gas hot water heaters throughout the building and one is located in the boiler room.

HVAC

Heating is provided by two oil/gas fired boilers that were replaced in 2001 and by rooftop package units. Cooling is supplied by approximately 95% window units and some rooftop package units. The heating/cooling distribution system is a 2-pipe system using fan coil units, air handlers, and unit ventilators. Unit ventilators were replaced in 2012. Fresh air is supplied by infiltration and some by air handling units. Ceiling-mounted exhaust fans are installed in a few restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

Facility Executive Summary

Approximately 5% of the school is sprinkled and the remainder has fire extinguishers. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pole mounted transformer. Power distribution from branch panels is typically copper. Lighting and branch wiring is typically 3-wire grounded serving a combination of recessed, surface-mounted, and pendent-mounted fluorescent and incandescent. Emergency lighting is present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces, balconies, and interior corridors and do not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is not centrally monitored. Telephone and data systems are combined and do not include dedicated closets or cabinets. The building includes partial internal security system that is actuated by optical devices and is centrally monitored.

Other Electrical Systems: The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, detention, laboratory, medical equipment, food service equipment and kitchen grease trap. The building also includes fixed casework, window treatments, floor grilles and mats, and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site. There is sufficient parking capacity for the occupants. Only two out of 110 parking spaces are handicap spaces and path to building entrance does not comply with ADA requirements. Landscaping is mature and is not irrigated. Drainage is handled by area drains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school has an 8,000 gallon fuel oil above ground tank.

Facility Description:

Walker Mill Middle School is a two-story, 129,348 square foot facility located on a 37.8-acre site at 800 Karen Blvd in Capital Heights, MD. The original building was constructed in 1970. There were no records that indicated any additions were added or any major renovations completed since that time.

ACCESSIBILITY ISSUES

Access to this school via the parking area is limited by the lack of compliant curb cuts, assisted entrances and interior amenities such as signage, door hardware and restroom modifications to support the physically challenged. The facility is not generally in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade and concrete. The buildings sub-floor construction consists of cast in place concrete.

B. SHELL

The superstructure is load bearing masonry construction. Floor construction is slab on grade and metal pan with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer. Exterior windows are aluminum sash with fixed and operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically flat with built-up roof. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior construction partition wall types typically include painted CMU and brick finishes. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails, and toilet partitions. Toilet configurations and accessories do not comply with the current ADA requirements. Interior graphics and/or signage do not comply with ADA requirements. Stair construction includes steel risers and treads with tile finishes. The interior wall finishes are typically painted CMU and exposed brick. Floor finishes in common areas is typically terrazzo, ceramic tile, vinyl composition tile and carpet. Floor finishes in assignable spaces is typically vinyl tile and wood. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 15,300 square feet of 12x12 vinyl asbestos tiles. Ceiling finishes in common areas are typically 2x2 or 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically 2x2 or 2x4 suspended acoustical panels.

D. SERVICES**Conveying**

Conveying equipment includes one hydraulic elevator.

Plumbing

Fixtures are original. There are five handicap equipped toilet stalls in the facility but they are not ADA compliant. Domestic water distribution is copper and galvanized steel. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by heat exchangers boilers and a 400 gallon storage tank. The system is original.

HVAC

Heating is provided by two hot-water boilers. The units are oil-fired. Cooling is supplied by a centrifugal chiller in the boiler room with an external Cooling Tower. There are 3 air handling systems (rooftop package units) providing air distribution. Heated and chilled water is distributed through a 2-pipe system using the main air handlers, fan coil units and fin tube radiators. Fresh air is supplied by air handling units. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

Facility Executive Summary

The electrical service is fed from a pad mounted transformer. Power distribution from branch panels wiring is typically copper, 3-wire grounded. Lighting and branch wiring is typically 3-wire grounded serving recessed and surface-mounted fluorescent and some incandescent. Emergency power and lighting is present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors, etc.) and do not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are separate and include some dedicated closets or cabinets. The building includes an internal security system that is actuated by combination) devices and is centrally monitored.

Other Electrical Systems: The building has a small (15?)KW emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, medical equipment, food service equipment and kitchen grease trap. The building also includes fixed window treatment furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site. There is sufficient parking capacity for the occupants where two out of 125 are handicap spaces and path to building entrances does not comply with ADA requirements. Drainage is handled by area drains. Concrete sidewalks are immediately adjacent to the facility. There is site lighting for vehicular and pedestrian night traffic. The school has a 8,000 gallon fuel oil tank with level and leak detection systems that was installed in 2008.

Current Repair Cost: \$22,177,072.62**Replacement Cost:** \$34,614,573.90**FCI:** 64.07%

Facility: \Middle Schools\Walker Mill Middle_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems	B2020	Exterior Windows	System	Beyond Useful Life	Renew System	1	Ea.	\$14,580,587 \$363,468	\$7,596,486 \$189,367	\$22,177,073 \$552,835	Necessary- 2-5 Yrs	Deferred Maintenance	Exterior window applications are from original construction. The windows are fixed and operable depending on the location of the installation. The fixed windows are in fair condition, however, the operable windows are in poor condition. Several of the windows no longer function properly. Universal upgrades are recommended with-in the next five years.
	B2030	Exterior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$231,533	\$120,629	\$352,162	Necessary- 2-5 Yrs	Deferred Maintenance	The exterior door system is in poor condition. Several of the doors have been broken into with tools and the damage remains after the corrective repairs. Doors are rusted and in some cases the hinges are broken. Universal upgrades are recommended.
	C1030	Fittings	System	Beyond Useful Life	Renew System	1	Ea.	\$344,066	\$179,258	\$523,324	Recommended -3-10 Yrs	Deferred Maintenance	The fitting systems are from original construction with few exceptions. Life cycle issues warrant universal replacement within the next ten years.
	C3010230	Paint	System	Beyond Useful Life	Renew System	1	Ea.	\$305,490	\$159,160	\$464,650	Recommended -3-10 Yrs	Deferred Maintenance	This school appears to be on a consistent painted finish renewal program. The painted finishes are in fair condition and expected to have an accelerated rate for renewal. This project provides a budgetary consideration for renewal within the next ten years.
	C3010230	Tile	System	Beyond Useful Life	Renew System	1	Ea.	\$455,500	\$237,316	\$692,816	Recommended -3-10 Yrs	Deferred Maintenance	The tile finish in the restrooms is in fair condition and replacement is warranted.
	C3020410	VCT	System	Beyond Useful Life	Renew System	1	Ea.	\$292,645	\$152,468	\$445,113	Recommended -3-10 Yrs	Deferred Maintenance	Tile floor finish is mainly in the classrooms and is in fair condition. Considering the high traffic use of the classrooms upgrades are recommended within the next ten years.
	C3020410	Carpet	System	Beyond Useful Life	Renew System	1	Ea.	\$22,850	\$11,905	\$34,755	Necessary- 2-5 Yrs	Deferred Maintenance	The carpet installation is beyond the expected life cycle for this type of application. There are sections of stains and cuts that may cause a tripping hazard. Universal replacement is recommended.

Year Built:
Last Renovation:

Facility Description:

William Wirt Middle School is a partial three-story, 106,318 square foot facility located on an 18.5-acre site near MD Route 295 (Baltimore-Washington Parkway) in Riverdale, MD. The building was constructed in 1964 and has had no additions constructed or major renovations performed since that time.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls with a partial slab-on-grade and partial suspended slab over a crawl space. The building does not have a basement.

B. SHELL

The superstructure is concrete frame. First floor construction is suspended concrete pan joist slab on concrete beams, columns and spread footings. Second and third floor construction is concrete pan joists and slab. Roof construction over the first floor level is steel joists, metal deck, and cementitious fiber (Tectum) deck. The gymnasium roof structure is steel frame and Tectum decking. The single-story portion of the exterior enclosure is comprised of walls of brick veneer over CMU. The two-story portion is exposed aggregate pre-cast panels. Exterior windows are aluminum sash with fixed and operable single-pane glazing. Exterior doors are hollow metal steel in hollow metal frames. Roofing is typically low-slope, built-up roofing with gravel ballast, which was replaced in 2003. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior partition wall types are typically painted CMU. Interior doors are generally solid core wood doors with hollow metal frames. Doors have bored lockset hardware. The accesses to exit (corridor) doors are not fire labeled. Interior fittings include chalk and tack boards, graphics, toilet accessories, shelving, handrails and toilet partitions. Toilet configurations and accessories do not comply with ADA requirements. Interior graphics and signage do not comply with ADA requirements. Stair construction includes concrete risers and treads with vinyl composition (VCT) tile finishes and aluminum tread nosings. The interior wall finishes are typically paint on CMU. Toilet walls are glazed CMU wainscot and painted CMU. Floor finishes in common areas are typically terrazzo on the first floor and vinyl asbestos tile (VAT) on the second and third floors. Floor finishes in assignable spaces is typically VCT on the first floor and VAT on the second and third floors. Floor finishes in toilets are 1x1 ceramic tiles. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 70,500 square feet of 9x9 VAT and 200 square feet of 12x12 VAT. Ceiling finishes in common areas are typically 2x4 suspended acoustical panels. Ceiling finishes in assignable areas are typically 2x4 suspended acoustical panels. Acoustical ceilings, including the grid system, were replaced on the first floor in 2005. The balance of the acoustical panels was replaced in 2006. Toilets and kitchen have painted drywall ceilings.

D. SERVICES

Conveying

The building includes one hydraulic elevator. The unit is not ADA rated.

Plumbing

Fixtures were replaced in 2007. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is a combination of roof drains and scuppers. Domestic hot water is provided by a gas hot water heater with two 200 gallon storage tanks and circulators that were installed in 2002.

HVAC

Heating is provided by two gas-fired steam boilers, which were installed in 2002, with all new ancillary equipment that supplies steam to systems and hydronic heating water via heat exchanger through a 2-pipe system serving ductwork, 10 major air handlers, fan coil units, and fin tube radiators. Cooling is supplied by individual window units and roof top package units and some small DX units. Fresh air is supplied by air handling units. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Facility Executive Summary

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer which was installed in 2005. Power distribution from branch panels wiring is copper. Lighting and branch wiring is typically 3-wire grounded serving recessed, surface-mounted and pendent-mounted fluorescent with some incandescent. Emergency battery powered lighting is present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in common spaces, interior corridors, etc., and does not comply with ADA requirements. The system is activated by pull stations and smoke detectors and is centrally monitored. The telephone and data systems are separate. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, gymnasium, audio-visual equipment, food service equipment and grease trap interceptor. The building also includes fixed casework and window treatments.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available in a parking lot on the site. There is sufficient parking capacity for the occupants where 10 out of 153 are handicap spaces and paths to building entrances appear to comply with ADA requirements. Landscaping is sparse. There are some low lying shrubs near the main entry. Drainage is handled primarily by surface discharge, plus a small amount of sub-surface discharge. Concrete sidewalks immediately adjacent to the facility are in good condition. There is site lighting for vehicular and pedestrian night traffic. The school has a 15,000 gallon fuel oil tank of dual wall construction with level and leak detection systems.

Facility: \High Schools\Annex Bldg. at Suitland High
Address: 5200 Silver Hill Road, Suitland, MD 20028

Attributes:

School Area	HSC
Congressional	4
County Council	7
Historical Building	No
Legislative	24
Original Building	Built in 1956, 70,993 S.F.
School Board District	7
School Grade	9th-12th

General Information:

Function:	High School	Year Built:
Gross Area:	70,993 S.F.	Last Renovation:

Facility Description:

The Annex Building at Suitland High School is a two-story, 70,993 square foot facility located on a 24.5-acre site close to Route 458 and Route 4 (Pennsylvania Avenue) in Forestville, MD. The original building was constructed in 1956, with no additions constructed or major renovations performed since that time.

ACCESSIBILITY ISSUES

The facility is not in compliance with ADA requirements. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade for the first floor and metal pan with lightweight fill for the second floor. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel framed. Roofing is typically low-slope with built-up roof. The roof was replaced in 2010.

C. INTERIORS

Interior partition wall types are typically painted CMU. Interior doors are generally solid core wood doors with hollow metal. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes concrete risers and treads with metal and terrazzo finishes. Interior wall finishes are typically glazed blocks and ceramic tiles. Floor finishes in common areas is typically terrazzo, ceramic tile, vinyl composition tile and carpet. Floor finishes in assignable spaces is typically vinyl tile, carpet, wood, and ceramic tiles.

D. SERVICES**Conveying**

The building does not have an elevator.

Plumbing

The plumbing fixtures are original. Domestic water distribution is original and consists of copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building does not have a sprinkler system, except in janitors closets.

HVAC

Heating is provided by two steam gas fired boilers that supply ceiling mounted fan coil units, fin tube radiators, and terminal units throughout the building. The boilers had tube repairs done in 2003 and should be replaced. Cooling is provided by individual window units and split systems for the recent science lab renovation. Distribution is a 2-pipe system to fan coil units. Fresh air is supplied mostly by infiltration. Controls are low voltage electrical thermostats and pneumatic. The system is not centrally monitored or controlled. The original distribution system and the boilers should be scheduled for upgrades or replacement.

Electrical

A pad mounted transformer provides power to the buildings main panel. Minor renovations were done when the window units were added in 1998, but most of the electrical distribution system is original and inadequate. Lighting has not been upgraded and light levels are generally inadequate. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a propane fired 5 Kw emergency generator.

Communication and Security

The system consists of visual/audible annunciators, manual pull stations, and heat/smoke detectors. The system was installed in 1994, but does not comply with ADA or life safety requirements and should be replaced. Telephone and data systems are separate, not located in dedicated closets, and do not have independent cooling systems. The security system consists of motion sensors and is inadequate.

Facility Executive Summary

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where two out of 50 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system.

Current Repair Cost: \$13,713,809.51**Replacement Cost:** \$19,252,749.74**FCI:** 71.23%

Facility Executive Summary

Facility: \High Schools\Belair Annex (Part of Bowie HS)**Address:** 3021 Belair Drive, Bowie, MD 20715**Attributes:**

School Area	HSC
Congressional	5
County Council	7
Historical Building	No
Legislative	23A
Original Building	Built in 1963, 102,351 S.F.
School Board District	5
School Grade	9th

General Information:

Function:	High School
Gross Area:	102,351 S.F.

Year Built:
Last Renovation:

Facility Description:

Belair Annex High School is a two-story, 102,351 square foot facility located on a 29.5-acre site close to Route 450 in Bowie, MD. The original building was constructed in 1963 and no additions were constructed or major renovations performed since that time. The building is a part of Bowie High School.

ACCESSIBILITY ISSUES

The facility is not in compliance with ADA requirements. Although the main entrance is handicapped accessible and two restrooms are in compliance with ADA requirements, there is no conveyance equipment in the facility. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building has a lower floor comprised of cast in place concrete on one side. The building has an unexcavated cross base of CMU construction.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade for the first floor and metal pan with lightweight fill on the second floor. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU and pre-cast architectural panels over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically low-slope with built-up roof and was in poor condition with reported leaks in 2007.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Toilet configurations and accessories are inadequate and do not comply with ADA requirements. Interior graphics is inadequate and do not comply with ADA requirements. Stair construction includes concrete risers and treads with steel and tile finishes. The interior wall finishes are typically tiles. Floor finishes in common areas is typically terrazzo, ceramic tile, vinyl composition tile and VAT. Floor finishes in assignable spaces is typically vinyl tile, VAT and wood. Ceiling finishes in common areas are suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster or suspended acoustical panels and exposed deck.

D. SERVICES**Conveying**

The building does not have an elevator.

Plumbing

The plumbing fixtures are original with the exception of low flow toilets, which were recently installed. Domestic water distribution is original copper and galvanized piping. Rusty water and previous line failure indicate the domestic water system needs to be replaced. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drainage system is a combination of roof drains and gutters with downspouts. Drains cause flooding at the front of the building and water seepage through the crawl space has resulted in floor damage. The building does not have a sprinkler system.

HVAC

Heating is provided by two steam, oil fired boilers that supply ceiling mounted fan coil units, air handlers, fin tube radiators and terminal units throughout the building. Cooling for the office area is provided a roof mounted cooling only DX unit. Classrooms are cooled by individual window units. Distribution is a 2-pipe system to fan coil units, air handlers, fin tube radiators and terminal units. Fresh air is supplied mostly by infiltration. Controls are low voltage electrical thermostats and pneumatic. The system is not centrally monitored or controlled. The entire HVAC system should be scheduled for upgrades or replacement.

Electrical

A pole mounted transformer provides service to a main disconnect. Minor additions were made in 1998 to accommodate the window air conditioning, but most of the distribution system is original and is inadequate. Lighting has been upgraded to electronic ballast and T-8 lamps. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building does not have an emergency generator.

Facility Executive Summary

Communication and Security

The system consists of visual/audible annunciators, manual pull stations, and heat/smoke detectors. The system was replaced in 2003, is adequate, and complies with most ADA or life safety requirements. Telephone and data systems are separate, not located in dedicated closets and do not have independent cooling systems. The security system consists of motion sensors and a CCTV system and is adequate.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where two out of 93 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The Underground Fuel Tank was replaced in 2008.

Current Repair Cost: \$18,273,547.34**Replacement Cost:** \$26,422,346.12**FCI:** 69.16%

Facility Executive Summary

Facility: \High Schools\Bladensburg Inst Center (Annapolis Rd Academy)**Address:** 5150 Annapolis Road, Bladensburg, MD 20710**Attributes:**

School Area	HSC
Congressional	4
County Council	5
Historical Building	No
Legislative	47
Original Building	Built in 1939, 26,658 S.F.
School Addition 1	Built in 1953, 880 S.F.
School Addition 2	Built in 1967, 27,719 S.F.
School Addition 3	Built in 1995, 320 S.F.
School Board District	4
School Grade	6th-8th

General Information:

Function:	High School
Gross Area:	55,577 S.F.

Year Built:**Last Renovation:****Facility Description:**

Bladensburg Institutional Center is a two-story, 55,577 square foot facility located on a 4.4-acre site close to MD Route 295 (Baltimore-Washington Parkway) in Bladensburg, MD. The original building was constructed in 1939 and additions were constructed in 1953, 1967, and 1995, with major renovations performed in 1995 and 2002 (second floor, 18,000 S.F. and ADA Upgrade, 1,230 S.F.).

ACCESSIBILITY ISSUES

The facility was constructed prior to any consideration to the physically challenged and is not generally in compliance with ADA requirements. This school is currently being used to support special needs students that may have behavioral issues. According to the building support staff, students that are physically challenged are redirected to a suitable school that could better serve their needs. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings. The building does not have a basement.

B. SHELL

The superstructure is steel frame, concrete frame, and load bearing CMU walls. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel door applications. Roofing is typically flat with built-up roof and is good condition. Entrances do not comply with ADA requirements. Considering the age of the current applications and the current condition, universal upgrades are warranted. Any projects recommended are expected to be completed as part of a universal upgrade effort.

C. INTERIORS

The age of interior finishes is mixed considering the recent second floor renovation. The second floor finishes were upgraded as part of an effort to enhance the painted surfaces, floor surfaces, and ceiling finishes. The first floor interior finishes remain as the original applications. Interior construction partition wall types typically include painted CMU and drywall. Interior doors are generally solid core wood doors. Interior fittings include chalk and tack boards, graphics, toilet accessories, shelving, handrails and toilet. Toilet configurations and accessories are inadequate and do not comply with ADA requirements. Interior graphics and/or signage are inadequate and do not comply with ADA requirements. Stair construction includes steel risers and treads with concrete finishes. The interior wall finishes are typically painted drywall and prefinished CMU. Floor finishes in common areas are typically vinyl composition tile. Floor finishes in assignable spaces are typically vinyl tile, wood and carpet. Ceiling finishes in common areas are suspended acoustical panels. Ceiling finishes in assignable areas are suspended acoustical panels.

D. SERVICES**Conveying**

The building includes an elevator that was added in 1995.

Plumbing

Fixtures appear to be original. Domestic water distribution is copper and galvanized steel piping. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by gas water heaters.

HVAC

Heating is provided by two gas boilers that are showing some signs of deterioration. Cooling is supplied by window units for the classrooms and a roof mounted package unit for the administration area. The heating distribution system is a 2-pipe system using air handlers, fan coil units, and fin tube radiators. Fresh air is supplied by fan coil units in heating season. Controls are mostly manual and are not centrally controlled. The entire cooling system should be upgraded or replaced. The system balancing should be checked and adjusted as required.

Facility Executive Summary

Fire Protection

The building has a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution from branch panels is typically copper, 3-wire grounded. Lighting and branch wiring is typically 3-wire grounded serving fluorescent fixtures. Illumination is generally adequate, but the system should be upgraded to energy efficient fixtures, lamps and electronic ballasts. Battery pack emergency lights are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in common spaces and interior corridors and does not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that includes motion detectors and a limited CCTV system that is centrally monitored.

Other Electrical Systems

The building does have an emergency generator and the fuel tank was replaced in 2005.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where one out of 77 is handicap parking space with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has a 10,000 gallon fuel oil tank that was installed in 1995.

School Addition 2	Built in 1998, 9,150 S.F. (Relocatables)
School Board District	5
School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	280,306 S.F.

Year Built:**Last Renovation:****Facility Description:**

Bowie High School is a two-story, 271,156 square foot facility located at 15200 Annapolis Road on a 29.5-acre site in Bowie, MD. The original building was constructed in 1965 and additions were constructed in 1968 and 1998 (Six CR Modular - State Owned and Three State Owned Modular), with no major renovation performed, with exception of the Science Renovation projects in 2002 and 2010. The facility has 12 temporary buildings on the site.

ACCESSIBILITY ISSUES

Paths to the main entrance and cafeteria have curb cuts and the doors are wide enough for wheel chair access but lack push button wall switches and automatic door openers. The facility is two/three stories and has only one elevator. All programs in the facility are handicap accessible via elevator. Installation of a wheel chair lift was completed in 2012.

A. SUBSTRUCTURE

The building typically rests on the concrete footings and foundation walls. Several structural cracks were observed in 2007 in the boiler room that indicates possible settlement or damage to the foundation. It is recommended that the facility be further investigated by a structural engineer for building integrity. The building does not have a basement, but has crawl spaces with several steam leaks from pipes. It was previously reported that water collects in the pit of the elevator and the school often has to use external pumps to remove it.

B. SHELL

The superstructure is load bearing masonry walls. Roof construction is metal pan with lightweight fill and is resting on open web steel joist roof framing. The exterior enclosure is brick veneer over CMU with Tecfab fireproof wall panels (an ultra-thin, prefabricated tablet of lightweight reinforced concrete with glass embedded into the panel). Exterior windows are typically aluminum sash with operable single-pane glazing. Fire exit windows are available in all the classrooms. Some of the classrooms also have an exterior door for emergency egress. The exterior doors in the original building are hollow metal steel which are rusting and damage to weather-stripping failure, and some are difficult to operate. The facility has a low-slope built up roof with gravel ballast. The built-up roof was replaced in 2006. The roof slope is adequate.

C. INTERIORS

Interior partition wall types typically include painted CMU with glazed block wainscot in the corridors, drywall, and metal folding partitions in science labs. The interior walls were repainted in 2008. Interior doors, including fire doors with no fire ratings, are generally solid core wood doors with metal frames. Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. The classrooms have original black-boards. All the old toilet accessories are original and need to be replaced. The mirrors in the restrooms need to be replaced. Stair construction includes concrete risers and treads with ceramic tile finishes. There is also a metal ladder for roof access through the roof hatch.

Interior wall finishes are typically painted CMU, drywalls, and folding metal partitions in two classrooms. The building was repainted in 2008. Floor finishes throughout the building are typically vinyl composition tiles (VCT), vinyl asbestos tiles (VAT), terrazzo, carpet, and ceramic tiles. There is VAT floor finish in multi-purpose room and several classrooms on ground, first, and second floors. There is carpet in the offices, teachers lounge, library, and classroom. There is ceramic tile in the restrooms. The wood parquet flooring in the gymnasium is uneven across the floor and in one corner. The overall ceiling finishes are typically suspended acoustical ceiling tiles. There are plastered ceilings in the boiler room.

D. SERVICES

Conveying

Conveying equipment includes one hydraulic 3500# capacity elevator.

Plumbing

Facility Executive Summary

The plumbing fixtures are original, rusted and stained. Domestic water distribution is copper and the sanitary waste system is cast iron. Rain water system is combination with roof drains, scuppers, and downspouts. Domestic hot water is provided by two gas water heaters and a 1000 gallon storage tank with steam converters.

HVAC

Heating is provided by three oil fired brick-set steam boilers, with a steam to hot water converter. All heating system equipment is aged. Cooling is supplied primarily by window units that are inadequate and some roof-top units. The heating distribution system is 2-pipe system using air handlers, fin tube radiators, and unit ventilators installed throughout the entire building, with many steam and condensate leaks in the crawl spaces and chases. There may be asbestos containing materials in the crawl spaces and boiler room that may require further study. Fresh air is supplied by unit ventilators and air handling units. There is a roof-top HVAC unit serving the administrative area and a new air handler installed in (2005) in the multi-purpose room. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system. The system balancing should be checked and adjusted as required.

Fire Protection

The building does not have a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to an originally installed (1964) main panel with a sub-panel added in 2005 for the window air conditioning equipment that does not appear to be able to be deactivated through the main incoming service bus. Power distribution from branch panels wiring is typically copper. Lighting and branch wiring is typically serving recessed, surface-mounted and pendant-mounted fluorescent, and some incandescent fixtures. Emergency power and battery powered lighting are present and exit signs are present at exit doors and near stairways.

Communications and Security

The fire alarm system consists of audible annunciators in common spaces, interior corridors, etc. It is an original Ellenco System and does not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The building has an emergency generator and the fuel tank was replaced in 2004.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Overall there are 22 reserved handicap spaces out of total about 531 parking spaces. Individually, the public library has 132 parking spaces with six handicap spaces, the auditorium has 196 parking spaces with eight handicap spaces, and the school has 203 parking spaces with eight handicap parking spaces. There is sufficient parking capacity for the occupants, but is insufficient parking capacity for special occasions, especially when a function in the auditorium coincides with a game in gymnasium. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The facility has a 19,073 gallon fuel oil storage tank that was installed in 1999. The natural gas service to the facility is small, serving only hot water heaters.

Current Repair Cost: \$33,597,627.93**Replacement Cost:** \$74,365,161.76**FCI:** 45.18%

General Information:

Function:	High School
Gross Area:	168,366 S.F.

Year Built:
Last Renovation:**Facility Description:**

Central High School is a two-story, 168,366 square foot facility located on a 60.5-acre site close to MD Route 214 (Central Ave.) in Capitol Heights, MD. The original building was constructed in 1961, additions were constructed in 1962, with a major renovation performed in 1982. A Science Renovation (2,220 S.F.) was performed in 1996, FY04 ASP - Two Boiler Replacement was performed in 2005, FY06 CF - Roof Replacement was performed in 2006, science renovation in 2009, Administrative Area, Lobby Area, Kitchen and HVAC renovations in 2012.

ACCESSIBILITY ISSUES

This facility was designed and constructed without consideration for handicap accessibility. The signage, drinking fountains, stairs, door hardware, elevator, restrooms, and locker-rooms are not handicap accessible. Efforts have been made to make the facility handicap accessible with installation of handicap parking spaces, curb cuts, and an access ramp to the main entrance. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade with concrete footings that are not showing signs of settlement or damage. The building does not have a basement; however, the mechanical room is located in a sub-floor construction of cast in place concrete that does not show signs of settlement or indications of water infiltration.

B. SHELL

The superstructure is steel frame and load bearing masonry walls. Floor construction is slab on grade and metal pan with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer with pre-fabricated panels near the window installations. Exterior windows are original aluminum sash with fixed and operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically flat with built-up roof and a rolled asphalt application over the gym and cafeteria. Both roof applications were installed in 2006. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior partition wall types typically include painted CMU, drywall, and tile. Interior doors are generally solid core wood doors with hollow metal frames. Recently, the interior door system was partially upgraded with the removal and replacement of 50 interior doors. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes steel risers and treads with rubber finishes. Interior wall finishes are typically painted CMU and tile. Floor finishes in common areas are typically terrazzo, vinyl composition tile and carpet. Floor finishes in assignable spaces are typically vinyl tile. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 19,325 square feet of vinyl asbestos tiles and 15,200 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically suspended acoustical panels.

D. SERVICES**Conveying**

Conveying equipment includes one hydraulic elevator.

Plumbing

The plumbing fixtures are original. Domestic water distribution is copper and galvanized steel piping and the sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by a gas water heater with storage tanks and circulating pumps, which were installed in 2003.

HVAC

Facility Executive Summary

Heating is provided by two gas/oil fired steam boilers, which were installed in 2004, with a steam to hot water heat exchanger. Cooling is supplied by rooftop package units; air cooled chillers, and DX units throughout the complex. The heating/cooling distribution system is a ductwork and 2-pipe system using air handlers, fan coil units, fin tube radiators, and unit ventilators. Fresh air is supplied by air handling units. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and digital and are not completely centrally controlled by an energy management system.

Fire Protection

The building has a partial fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from pad mounted transformers that delivers power to a main panel with utility company curtailment devices. There was a reported problem with the local utility transformers or distribution in 2007. Power distribution from branch panels wiring is typically copper, 3-wire grounded and is inadequate. Lighting and branch wiring is typically 3-wire grounded serving recessed, surface-mounted and pendent-mounted fluorescent and some incandescent. Illumination is generally inadequate throughout the facility. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in common spaces and interior corridors and does not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are separate and some include dedicated closets or cabinets that are inadequately secured and cooled. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The building has a 135kW emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where two out of 250 are handicap parking spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has a 20,000 gallon fuel oil tank that was installed in 1995.

School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	335,141 S.F.

Year Built:

Last Renovation:

Facility Description:

Crossland High School is a two-story, 335,141 square foot facility located on a 36 acre site close to MD Route 5 in Temple Hills, MD. The original building was constructed in 1963 with additions constructed in 1965, 1966, 1975, with science renovation performed in 2000 and 2012, and a new Auditorium constructed in 2012.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements. There is no change of color and texture between the curb cut and the adjoining areas. Most Interior doors have door knobs instead of levered locks.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, or sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade for the first floor and metal pan with lightweight fill for the second floor. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal with metal frames. Roofing is typically low-slope (except for the MPR, which is pitched) with built-up roof and standing seam metal.

C. INTERIORS

Interior partition wall types are typically painted CMU. Interior doors are generally solid core/hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes concrete risers and treads with steel and terrazzo finishes. The interior wall finishes are typically painted CMU and glazed block. Floor finishes in common areas are typically terrazzo. Floor finishes in assignable spaces is typically vinyl tile, resilient tiles, carpet, and wood. During the 2008 Assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 60,645 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster, suspended acoustical tile, suspended acoustical panels, and exposed deck. Some metal pan ceiling finishes were replaced in 2011 in the 200 wing (200-233) and the hallways.

D. SERVICES

Conveying

The building has a 3500# hydraulic elevator and a wheel chair lift that meets most ADA concerns.

Plumbing

Fixtures are original and in fair condition except for the new low flow toilets, which were installed in 2009. Domestic water distribution is original and consists of copper and galvanized piping. Sanitary waste system is cast iron. Domestic hot water is provided by a gas fired water heater. Rain water drain system is combination of internal with roof drains and over flow scuppers. The building has a sprinkler system that provides coverage in the vocational addition only.

HVAC

Two separate boiler rooms serve the buildings. Heating is provided by three new steam, oil fired boilers that supply heated water to air handlers, fan coils and fin tube radiators. Cooling is provided by a combination of a centrifugal chiller that has been converted to R-123, roof mounted air cooled multi-zone and single zone air handlers, split systems and window units. Fresh air is supplied by air handlers and infiltration. Controls are low voltage electrical thermostats, pneumatics. The system is not centrally monitored or controlled. Air balance should be checked and adjusted as required.

Electrical

Facility Executive Summary

A pad mounted transformer provides service to the main building. Lighting in the building was upgraded in 2007. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has a 150 KW emergency generator.

Communication and Security

The system consists of audible manual pull stations and heat/smoke detectors. Network infrastructure was updated in 2012. The security system consists of motion sensors and a limited CCTV system.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where six out of 574 are handicap parking spaces with strip paths to building entrance. A new parking area was established with the Auditorium addition that includes 77 parking spaces with 4 handicap spaces. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. An in-ground fuel storage system was installed in 1993, including double walled construction with leak detection and level indication.

Current Repair Cost: \$44,514,307.60**Replacement Cost:** \$89,087,796.69**FCI:** 49.97%

School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	281,281 S.F.

Year Built:**Last Renovation:****Facility Description:**

Duval High School is a one-story, 281,281 square foot facility located on a 33.6-acre site approximately one mile from I-495 (Capital Beltway) and I-295 (Baltimore-Washington Parkway) in Lanham, MD. The original building was constructed in 1960 and additions were constructed in 1961, 1967, 2007, with science renovations performed in 1999 (7,077 S.F.) and 2010 (7,750 S.F.), and a major renovation performed in 2005 (21,580 S.F.). The two-story classroom building and media center additions were complete in 2008.

This school is part of the Special Education Inclusion Initiative. A 14,000 S.F. building addition and 7,500 S.F. renovation of adjoining space are currently being programmed for a 2014 construction completion that will incorporate the special education program requirements. A parking lot extension will also be included to support the additional staff.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements, with exception of the 2007 addition. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls. The building does not have a basement, cellar or sub-floor.

B. SHELL

The superstructure is primarily steel tube columns with some wide flanged and junior beams as well. Floor construction is slab on grade. Roof construction is steel joists, bulb tees, and cementitious fiber decking. The exterior enclosure is comprised primarily of walls of brick veneer, plus some exposed aggregate concrete panels over CMU. Exterior windows are steel sash with fixed and operable single-pane glazing. In two classroom wings, the windows have been replaced with bronze colored aluminum sash windows with thermal insulating glass. Exterior doors are primarily satin finish aluminum frame systems, plus hollow metal doors and frames at the exits. Roofing is typically low-slope with built-up, gravel ballast roofing and it was replaced in 2000.

C. INTERIORS

Interior partition wall types are primarily painted CMU. The corridors are brick on CMU. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, and shelving, handrails and metal toilet partitions. The interior wall finishes are typically painted CMU. Floor finishes in common areas is typically terrazzo with aluminum divider strips. Floor finishes in assignable spaces is typically vinyl asbestos tile. In some classrooms vinyl tile has been replaced. The stage floor finishes have been replaced in the multi-purpose room in 2009 and the gym flooring was replaced in 2011. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically painted cementitious fiber decking. Some plastered ceiling finishes have been repaired in 2009.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

The plumbing fixtures were replaced in 2005, with exception of a few lavatories. Domestic water distribution is copper piping and the sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by a gas-fired water heater system with a storage tank, which was installed in 2004 and a gas-fired domestic water in Boiler Room No. 2.

HVAC

Facility Executive Summary

Heating is provided by two gas-fired boilers. The boilers and ancillary equipment was installed in 2004. There is an additional boiler room with two gas-fired steam boilers, which were installed in 2006. Cooling is generally supplied by window units. There is a large air-cooled roof top unit serving the east wing and is approximately twelve years old. There are separate DX HVAC systems serving the administrative areas. The heating/cooling distribution system is a 2-pipe system using air handlers, fan coil units, fin tube radiators, and unit ventilators. Fresh air is supplied by air handling units. Roof-mounted exhaust fans are installed in restrooms and ventilation is adequate. Controls and instrumentation are pneumatic, are not centrally controlled by an energy management system. The system balancing should be checked and adjusted as required.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel, which was replaced in 2005. Power distribution is from sub-panels with copper wiring. Lighting and branch wiring is typically serving recessed, surface-mounted, pendant-mounted fluorescents and some incandescent fixtures. Illumination was addressed in 2008. Emergency power and lighting is present and is battery powered. Exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors, etc., which was installed and upgraded in 2002, and appears to comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems:

The building does not have an emergency generator.

D. SERVICES**Conveying**

The building does not include conveying equipment.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment installed in 2012 and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 11 out of 239 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has two fuel oil tanks of dual wall construction installed in 1995 and 2007, with level and leak detection systems.

Current Repair Cost: \$24,998,780.81**Replacement Cost:** \$72,962,043.76**FCI:** 34.26%

Year Built:
Last Renovation:

Facility Description:

Eleanor Roosevelt High School is a three-story, 327,458 square foot facility located on a 40-acre site close to I-495 Capital Beltway in Greenbelt, MD. The original building was constructed in 1974 and an addition was constructed in 1990, with Science Renovation (6,256 S.F.) performed in 1995 and FY02 Science CR Renovation (3,094 S.F.) performed in 2005. The school has 22 temporary buildings on the site.

ACCESSIBILITY ISSUES

The main entrance to the original building and 1990 addition is handicap accessible, with curb cuts and ramps, and wide enough doors for wheelchair access, but lack push button wall switches and automatic door openers. Handicap accessible toilet stalls are available in the gang restrooms. Toilet configurations and accessories are adequate. Interior graphics and/or signage for ADA compliance are inadequate or missing in the building. The facility has three levels and one elevator. All programs in the facility are handicap accessible. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls. The building does not have a basement, but does have a crawl space.

B. SHELL

The superstructure is load bearing masonry walls with concrete floors and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over concrete masonry unit (CMU), single pane metal windows with operable frames, and hollow metal steel doors. Most of the exterior doors and door hardware throughout the building are original. Four exterior doors were replaced in 2007. The original building has low-slope built up roof with gravel ballast and the 1990 addition has single-ply rubber membrane roof that were replaced in 2007.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed wainscot and brick veneer in the corridors and gypsum drywalls in the modular. Interior doors are generally solid core wood doors with hollow metal frames. The door hardware is hard to lock and unlock. Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. The classrooms have original chalkboards. The facility has concrete stairs with concrete risers and treads and steel frame. There is a metal stair to access the roof through the roof hatch.

Interior wall finishes are typically painted CMU walls and laminated gypsum drywalls (1990 addition). Floor finishes throughout the building are typically vinyl composition tiles (VCT), carpet, terrazzo, and ceramic tiles. The VCT floor finish in the corridors and classrooms on the first and second floor of the original building and modular classrooms are worn and cracked on the surface. There are ceramic tiles in the kitchen and restrooms. The ceiling finishes are typically suspended acoustical. The Auditorium was repainted in 2012.

D. SERVICES

Conveying

The building includes one hydraulic elevator.

Plumbing

Sinks, faucets and other plumbing fixtures have not been upgraded. Domestic water distribution is primarily copper piping and the sanitary waste system is cast iron. Rain water system is internal with roof drains and scuppers. Domestic hot water is provided by gas hot water heater.

HVAC

Facility Executive Summary

Heating is provided by three oil/gas-fired boilers that were installed in 2000. Cooling is supplied by an absorption chiller and ceiling units in approximately 15 classrooms that were installed in 1998. The heating/cooling distribution system is a ductwork and 2-pipe system using air handlers and fin-tube radiators. Fresh air is supplied by infiltration and air handling. Ceiling-mounted exhaust fans are installed in restrooms and kitchen. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system. Mechanical systems upgrades are planned for FY- 2013 which include replacement of some piping , valves, hangers, insulation, pumps, storage tanks, AHU's, Fans, terminal units and controls.

Fire Protection

The building has a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from pad-mounted transformers that deliver power to a main panel. Power distribution wiring is typically copper and the system trips with increased current load. Lighting and branch wiring is serving recessed and surface-mounted fluorescent that were installed 2007. Illumination is generally adequate. Emergency power and lighting (with battery back-up) are located in the corridors. Exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of a main panel in the boiler room with audible and strobe annunciators in common spaces and interior corridors in fair condition, and appears to comply with ADA requirements. The system is activated by pull stations and strobe/horn alarm detection devices. The telephone and data systems are separate and none are installed in dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by contact devices, motion detectors, video cameras and is centrally monitored.

Other Electrical Systems: The building has dedicated grounding and no lighting protection. The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment installed in 2012 and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 7 out of 700 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has an underground fuel oil storage tank with level and leak detection systems installed in 2001.

Facility Executive Summary

Report Date: 08 Sep 2012

Facility: \High Schools\Eleanor Roosevelt High_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems	B2020	Exterior Windows	System	Beyond Useful Life	Renew System	1	Ea.	\$27,817,054 \$967,650	\$14,492,685 \$504,146	\$42,309,739 \$1,471,796	Necess ary- 2-5 Yrs	Deferred Maintena nce	The facility has very few windows and they are original, beyond useful life, and in fair condition. No major water leaks were reported through windows throughout the building. The flashing and caulking around the windows are in fair condition but are beyond useful life.
	B2030	Exterior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$624,807	\$325,525	\$950,332	Necess ary- 2-5 Yrs	Deferred Maintena nce	Most of the exterior doors and door hardware throughout the building are original, beyond useful life, and in fair condition (difficult to operate, worn, damaged, fail to close completely or slam). Four exterior doors were replaced in 2007.
	C1030	Fittings	System	Beyond Useful Life	Renew System	1	Ea.	\$916,384	\$477,436	\$1,393,820	Necess ary- 2-5 Yrs	Deferred Maintena nce	Interior fittings in the building include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. The classrooms have original chalkboards which are old, beyond useful life, and in fair condition. The toilet partitions are original, rusted/stained, and in poor condition. Most toilet accessories are beyond useful life and need to be replaced. The mirrors in the restrooms are in fair condition and need an upgrade.
	C3010230	Paint	System	Beyond Useful Life	Renew System	1	Ea.	\$1,326,514	\$691,114	\$2,017,628	Necess ary- 2-5 Yrs	Deferred Maintena nce	Large portion of the facility has not been painted for more than five years and the paint is in fair condition (stained and peeling off the walls).
	C3020410	Carpet	System	Beyond Useful Life	Renew System	1	Ea.	\$196,400	\$102,324	\$298,724	Necess ary- 2-5 Yrs	Deferred Maintena nce	The carpet in the main office, library, and three classrooms is old, beyond useful life, and in poor condition (worn and stained).
	C3030210	Acoustical Ceilings	System	Beyond Useful Life	Renew System	1	Ea.	\$1,935,301	\$1,008,292	\$2,943,592	Necess ary- 2-5 Yrs	Deferred Maintena nce	Acoustical ceiling tiles throughout the building are beyond useful life and in poor condition (stained from pipe condensation and warped, especially on the second floor).
	G2020	Parking Lots	System	Beyond Useful Life	Renew System	1	Ea.	\$1,090,068	\$567,925	\$1,657,993	Necess ary- 2-5 Yrs	Deferred Maintena nce	Asphalt surface is in fair to poor condition, with cracks, pot holes, and uneven surfaces. The parking surface was partially resurfaced in the past.

Prince George County Public Schools

13300 Old Marlboro Pike
Upper Marlboro, MD 20772

eCOMET Facility Report Facility Executive Summary

Report Date: 08 Sep 2012

G2030	Pedestrian Paving	System	Beyond Useful Life	Renew System	1	Ea.	\$49,371	\$25,722	\$75,093	Necess ary- 2-5 Yrs	Deferred Maintena nce	Concrete sidewalks immediately adjacent to the facility are old, beyond useful life, and in fair condition (with cracks and damaged edges).
D1010	Elevators and Lifts	System	Beyond Useful Life	Renew System	1	Ea.	\$217,882	\$113,516	\$331,398	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D2010	Plumbing Fixtures	System	Beyond Useful Life	Renew System	1	Ea.	\$2,553,700	\$1,330,477	\$3,884,177	Necess ary- 2-5 Yrs	Deferred Maintena nce	Fixtures are mostly in poor condition due to aging. Sinks, faucets and other plumbing fixtures were not upgraded from its original state. Most of the water fountains are original and in poor condition.
D2020	Domestic Water Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$182,636	\$95,153	\$277,789	Necess ary- 2-5 Yrs	Deferred Maintena nce	Domestic water distribution is primarily copper and is in fair to poor condition due to aging.
D2040	Rain Water Drainage	System	Beyond Useful Life	Renew System	1	Ea.	\$195,453	\$101,831	\$297,283	Necess ary- 2-5 Yrs	Deferred Maintena nce	Rain water system is internal with roof drains in fair condition.
D2030	Sanitary Waste	System	Beyond Useful Life	Renew System	1	Ea.	\$278,760	\$145,234	\$423,994	Necess ary- 2-5 Yrs	Deferred Maintena nce	Sanitary waste system is cast iron that is in poor condition due to aging.
D3040	Distribution Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$3,345,122	\$1,742,809	\$5,087,931	Necess ary- 2-5 Yrs	Deferred Maintena nce	The distribution system is typically ductwork, air handlers in good condition and fin-tube radiators which are in fair to poor condition due to aging.
D3060	Controls & Instrumentation	System	Beyond Useful Life	Renew System	1	Ea.	\$304,393	\$158,589	\$462,982	Necess ary- 2-5 Yrs	Deferred Maintena nce	Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.
D3070	Systems Testing & Balancing	System	Beyond Useful Life	Renew System	1	Ea.	\$243,515	\$126,871	\$370,386	Necess ary- 2-5 Yrs	Deferred Maintena nce	The control system (balancing) is in poor condition due to aging causing some areas to be cool while hot or warm in others.
D4010	Sprinklers	System	Beyond Useful Life	Renew System	1	Ea.	\$1,252,819	\$652,719	\$1,905,537	Necess ary- 2-5 Yrs	Deferred Maintena nce	The building has fire sprinkler system.
D5010	Electrical Service/Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$557,520	\$290,468	\$847,988	Necess ary- 2-5 Yrs	Deferred Maintena nce	The electrical service is fed from pad-mounted transformers that deliver 3000amps, 277/480v 3-phase, 4-wire power to a main panel. Power distribution wiring is typically copper 3-wire grounded and is inadequate (system trips with increase current load). Several switch gears are original and need update.
D5030	Communications and Security	System	Beyond Useful Life	Renew System	1	Ea.	\$871,526	\$454,065	\$1,325,591	Necess ary- 2-5 Yrs	Deferred Maintena nce	The fire alarm system consists of a main panel in the boiler room, with audible and strobe annunciators in common spaces and interior corridors in fair condition. The system is activated by pull stations, strobe/horn alarm, detection devices. The building includes an internal security system that is actuated by contact devices, motion detectors, video cameras and is centrally monitored.

Facility: \High Schools\Fairmont Heights High (Replacement)**Address:** Columbia Park Road, Forestville, MD 20743**Attributes:**

School Area	HSC
Congressional	4
County Council	5
Historical Building	No
Legislative	24
Original Building	Built in 2015, 188,203 S.F.
School Board District	4
School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	188,203 S.F.

Year Built:**Last Renovation:****Facility Description:**

The new Fairmont Heights High School is a 188,203 square foot facility located close to Eastern Avenue NE and US Route 50 in Capitol Heights, MD on property adjacent to the original school. The new facility is a replacement school designed to achieve LEED Gold (LEED for Schools rating) and is expected to be completed in 2015.

The cost model for this school is based on the available design drawings and planned construction.

Current Repair Cost: \$0.00**Replacement Cost:** \$49,681,127.36**FCI:** 0.00%

General Information:

Function:	High School
Gross Area:	193,222 S.F.

Year Built:

Last Renovation:

Facility Description:

Forestville Military Academy High School is located on a 28.6-acre site close to the I-495 beltway in Forestville, MD. The two-story, 193,222 square foot facility was originally constructed in 1965 and additions were constructed in 1965, 1982, 1988, and 1994. The whole facility is divided into four buildings, Building A through Building D. Building A was formerly a junior High school. Building D was formerly an elementary school, which became part of the Forestville High School in 1965. Building C was constructed in 1994 and currently contains a kitchen, library, and multipurpose room (with stage). Building B is the section joining building A and Building C. The school was completely renovated in 1994.

ACCESSIBILITY ISSUES

The main entrance is handicap accessible. The main entrance doors for Building B and Building D have ramps and are wide enough for wheel chair access, but lack push button wall switches and automatic door openers. Handicap toilet stalls are available in the gang restrooms on both the first and second floors. The metal hand rails are stained. The toilet configurations and accessories are adequate. Interior graphics and/or signage for ADA compliance are inadequate and missing in the building. An elevator provides access for the second floor and basement. All programs in the facility are accessible. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building has basement and crawl space.

B. SHELL

The superstructure is load bearing masonry walls with slab-on-grade floor and open web steel joist roof framing. Several structural cracks on the concrete walls observed in 2007 indicate that slab-on-grade may be settling or is damaged. The exterior enclosure is comprised of brick veneer over CMU, double pane metal windows with metal frames, and hollow metal steel doors. The exterior doors throughout the building were replaced in 1994 with the exception of the doors in Building D (old elementary school). The doors in Building D were not replaced in 1994 and are original. Roof construction is low-slope built-up roof with stone ballast and flashing the roof was replaced in 1994. The roof over Building D has four penthouses which houses the mechanical equipment. A partial roof replacement was conducted in 2012 and the reminder of the roof is expected to be replaced after 2013.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors and painted gypsum drywalls. Interior doors are generally hollow core wood doors with hollow metal frames. Interior fire doors in the corridors are hollow metal steel doors. The interior doors were replaced in 1994. Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. Most of the classrooms have original chalkboards. Toilet accessories such as metal toilet partitions are original, rusted and stained. There are concrete stairs with steel frame and rubber/vinyl floor finishes.

Interior wall finishes are typically painted CMU and gypsum drywalls. Floor finishes throughout the building are typically vinyl composition tiles (VCT), carpet, and terrazzo flooring. The VCT in the classrooms for Buildings A, B, and C were installed in 1994. The VCT in the classrooms and hallways of Building D was installed in 1994. The terrazzo flooring in the hallways of Buildings A, B, and C is original. The ceramic tiles in the restrooms were replaced in 1994. The overall ceiling finishes are typically suspended perforated acoustical tiles. The acoustical ceiling tiles were replaced in 1994.

D. SERVICES

Conveying

The building has a hydraulic elevator which satisfies most ADA requirements.

Plumbing

Facility Executive Summary

The plumbing fixtures are original. Domestic water distribution is original and consists of copper piping. Domestic hot water is provided by gas fired water heaters and a storage tank system. Sanitary waste system is cast iron. Rain water drainage system is internal with roof drains. The building has a sprinkler system.

HVAC

Heating is provided by two steam, dual fired boilers that supply air handlers, fin tube radiators, and terminal reheat coils throughout the building. Cooling is provided a new water cooled chiller with roof mounted cooling tower. Distribution is a 2-pipe system to air handlers with metal duct to each space. Fresh air is supplied by the roof mounted air handlers. Controls are a combination of low voltage electrical thermostats, pneumatic and DDC. The system is centrally monitored. There are code and safety issues due to chiller adjacent to boiler in the mechanical room.

Electrical

A pad mounted transformer provides service to a main disconnect. Most of the distribution system is original and breakers trip frequently. There was previously a general complaint of lack of adequate receptacles in class and office areas. Lighting has been upgraded to electronic ballast and T-8 lamps and light levels are adequate. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has an emergency generator. A previous assessment indicated the library needs more data outlets and electrical outlets.

Communication and Security

The system consists of visual/audible annunciators, manual pull stations and heat/smoke detectors. The system was upgraded several years ago but does not comply with ADA or life safety requirements and should be replaced. Telephone and data systems are separate, not located in dedicated closets, and do not have independent cooling systems. The security system consists of motion sensors and CCTV cameras and is adequate.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 7 out of 164 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has an underground fuel oil storage tank installed in 1993, equipped with level and leak detection systems. The outdoor track was replaced in 2012.

Current Repair Cost: \$25,115,123.61**Replacement Cost:** \$49,872,866.35**FCI:** 50.36%

Facility Executive Summary

Report Date: 08 Sep 2012

Facility: \High Schools\Forestville Military Academy_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems C1030	Fittings	System		Beyond Useful Life	Renew System	1	Ea.	\$15,876,289 \$441,599	\$8,271,547 \$230,073	\$24,147,835 \$671,672	Necess ary- 2-5 Yrs	Deferred Maintena nce	Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. Most of the classrooms have original chalkboards which are in fair condition. Toilet partitions are original, rusted/stained, and in poor condition. All old toilet accessories are beyond useful life and need to be replaced. The mirrors in the restrooms are in poor condition and need an upgrade.
C3020410	Carpet	System		Beyond Useful Life	Renew System	1	Ea.	\$151,536	\$78,950	\$230,487	Necess ary- 2-5 Yrs	Deferred Maintena nce	The carpet in some classrooms in Buildings A, B, and C is stained, worn, and in poor condition.
C3020410	Ceramic Tile	System		Beyond Useful Life	Renew System	1	Ea.	\$193,688	\$100,911	\$294,599	Necess ary- 2-5 Yrs	Deferred Maintena nce	The ceramic tiles in the restrooms were replaced in 1994 and are in fair to poor condition. The ceramic tiles are stained, worn, and are in poor condition.
A1010	Standard Foundations	Wall Foundations		Failing	Professional Services-Inspect foundation Walls	1	Each	\$10,171	\$5,299	\$15,471	Potentia lly Critical- 12 months	Building Integrity	Professional services to investigate foundation wall and/or moisture barrier failure. Structural cracks were observed on the building walls in the boiler room and hallways that indicate possible settlement or damage to the slab-on-grade.
D2010	Plumbing Fixtures	System		Beyond Useful Life	Renew System	1	Ea.	\$1,228,730	\$640,168	\$1,868,898	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D2020	Domestic Water Distribution	System		Beyond Useful Life	Renew System	1	Ea.	\$88,320	\$46,015	\$134,334	Necess ary- 2-5 Yrs	Deferred Maintena nce

School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	184,417 S.F.

Year Built:**Last Renovation:****Facility Description:**

Frederick Douglas High School is a two-story, 184,417 square foot facility located on a 31-acre site close to Highway 301 in Upper Marlboro, MD. The original building was constructed in 1960 and multiple additions were constructed in 1983, 1989 and 2003, with major renovation done in 1989.

ACCESSIBILITY ISSUES

The facility is accessible to handicap students and staff. The main entrance doors are wide enough for wheel chair access, but lack push button wall switches and automatic door openers for handicap and disabled access. Some of the restrooms and toilet stalls are wheel chair assessable. The stage in the cafetorium is handicap accessible via a wheel chair lift. Some of the temporary structures have wheel chair access ramps. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation. The building does not have a basement, but does have crawl spaces of concrete construction.

B. SHELL

The superstructure is load bearing CMU walls. Floor construction is a variety of materials, including metal pan with lightweight fill, cementitious material on metal lathe, and poured in place concrete, indicating multiple additions. Roof construction is also a variety of materials, including metal pan with lightweight fill and gypsum panel decking. The exterior enclosure is comprised of walls of brick veneer and decorative precast concrete panels over CMU. Exterior windows are aluminum sash with fixed and operable single-pane and thermo pane glazing. Exterior doors are hollow metal steel and 20-25% of them do not lock properly. Roofing is typically low-slope with built-up roof. The 1960 and 1989 portions of the roof were replaced in 2009.

C. INTERIORS

Interior construction partition wall types typically include painted CMU, glazed block wainscot in the corridors, and drywall. Interior doors are generally solid core and hollow wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, and toilet partitions. Stair construction includes steel risers and treads with tiles. The interior wall finishes are typically painted CMU and drywall. Floor finishes in common areas is typically terrazzo, ceramic tile, and vinyl composition tile. Floor finishes in assignable spaces is typically vinyl tile and carpet. There is carpet in the principals office, teachers lounge and conference room. Ceiling finishes in common areas and assignable areas are typically suspended acoustical panels.

D. SERVICES**Conveying**

Conveying equipment includes one hydraulic elevator.

Plumbing

Most of the plumbing fixtures are original. Sinks, faucets, and other plumbing fixtures were not updated but some urinals and toilets were updated. Domestic water distribution is copper piping and the sanitary waste system is cast iron and some plastic. Rain water system is external with roof drains and scuppers. Domestic hot water is provided by gas hot water heaters.

HVAC

Heating is provided by two oil fired boilers installed in 1988. Cooling is supplied by approximately 90% of roof top units and 10% of window units. The heating/cooling distribution system is ductwork and a 2-pipe system using air handlers, unit ventilators, and radiators. Fresh air is supplied by infiltration and air handling units. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic for heating and digital for cooling and are not centrally controlled by an energy management system.

Facility Executive Summary

Fire Protection

The building has a fire sprinkler system. Standpipes are included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution from branch panels wiring is typically copper. Lighting and branch wiring is typically serving recessed, surface-mounted, and pendent-mounted fluorescent and incandescent. Illumination is generally adequate. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors and appears not to be compliant with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are combined and do not include dedicated closets or cabinets that are inadequately secured and cooled. The building includes an internal security system that is actuated by optical devices and is centrally monitored.

Other Electrical Systems: The building has an emergency generator and the fuel was installed in 1997.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 9 out of 370 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school fuel oil tank has been removed.

Current Repair Cost: \$14,565,126.32**Replacement Cost:** \$49,426,217.86**FCI:** 29.47%

Facility: \High Schools\Frederick Douglass High_Original Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems	B2020	Exterior Windows	System	Beyond Useful Life	Renew System	1	Ea.	\$8,086,582 \$403,016	\$4,213,109 \$209,971	\$12,299,691 \$612,987	Necess ary- 2-5 Yrs	Deferred Maintena nce	Plumbing fixtures are mostly original and need update. Some of the fixtures are out of order and are covered with plastic to prevent students from using them. Some sinks are chipped, cracked, and have rust. Some faucets are slow and broken. Piping for both the hot and cold water is mostly original. The distribution system was not updated and needs update. Some of the faucets had low pressure that could indicate line blockage. Sanitary piping is beyond useful life and is outdated and in some areas is clogged and others leaking. The school has a functioning sprinkler system in most areas. The system is mostly original and may need update or replacement. Most of the electrical panels in hallways and classrooms are original and need update. Some panels have no capacity to expand at the time of need.

School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	236,861 S.F.

Year Built:
Last Renovation:**Facility Description:**

Friendly High School is a three-story, 236,861 square foot facility located on a 64.5-acre site close to MD Route 5 in Fort Washington, MD. The original building was constructed in 1970 and an addition was constructed in 1978, with no major renovation performed, except for Science Renovation (4,054 S.F.) in 2000, FY04 SR Roof Replacement in 2004, FY05 Code - Fire Alarms in 2006 and FY2011 Science renovation (7,600 S.F.). The school has seven portable buildings.

ACCESSIBILITY ISSUES

The building has some ADA compliant features, including an elevator, curb cuts, and ramp. Interior door hardware, original elevator, restrooms, and fire detection systems were not ADA compliant in 2007. ADA upgrades for the facility are currently planned. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade and has a lower floor of CMU construction.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill. The roof was replaced in 2007. The exterior enclosure is comprised of brick veneer over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel with hollow metal frames. Roofing is a combination of pitched and low-slope with built-up roof. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core/hollow wood doors with hollow metal. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes concrete risers and treads with steel inserts and terrazzo finishes. The interior wall finishes are typically painted. Floor finishes in common areas is typically terrazzo and vinyl composition tile. Floor finishes in assignable spaces is typically vinyl tile, carpet, wood and ceramic tile. During the 2008 facility Condition assessment, it was noted in the A.H.E.R.A. Management Plan that the school contains 18,800 square feet of vinyl asbestos tile. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically suspended acoustical panels, plaster, acoustical tiles and exposed deck. Also noted in the A.H.E.R.A. Management Plan, the school contains 7,200 square feet of asbestos containing transite ceiling tile.

D. SERVICES**Conveying**

The building two hydraulic elevator, one is original and the other was added in 1998 to meet most of the ADA requirements.

Plumbing

The plumbing fixtures are mostly original, except for the low flow toilets, which were installed in 2007. Domestic water distribution is original and consists of copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drainage system is internal with roof drains. The building has a sprinkler system that provides partial coverage.

HVAC

Heating is provided by three steam, dual fired boilers that supply fin tube radiators, air handlers, and terminal units throughout the building. Cooling is provided by two centrifugal chillers that have been converted to R-123. A roof mounted package unit provides cooling to the weight room. Fresh air is supplied by air handlers and infiltration. Seventeen air handling units were replaced in 2012. Controls are low voltage electrical thermostats, pneumatics, and a DDC system that is inoperative. The system is not centrally monitored or controlled.

Electrical

Facility Executive Summary

A pad mounted transformer provides service to the main building. Separate power service provides power to the auditorium building. Lighting in the building was upgraded in 2007 and light levels are adequate. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has two emergency generators but neither is operative.

Communication and Security

The system consists of audible annunciators, manual pull stations, and heat/smoke detectors. Kitchen range hood lacks a fire suppression system. Telephone and data systems are separate, not located in dedicated closets, and do not have independent cooling systems. The security system consists of motion sensors and a limited CCTV system that are inadequate.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 6 out of 324 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has an underground fuel oil storage tank without level and leak detection systems.

Current Repair Cost: \$29,728,913.55**Replacement Cost:** \$64,139,465.78**FCI:** 46.35%

County Council	9
Historical Building	No
Legislative	27A
Original Building	Built in 1956, 26,400 S.F.
School Addition 1	Built in 1975, 162,557 S.F.
School Addition 2	Built in 1991, 5,888 S.F.
School Board District	9
School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	194,845 S.F.

Year Built:**Last Renovation:****Facility Description:**

Gwynn Park High School is located on a 37.5-acre site close to Interstate 495 (Capital Beltway) in Brandywine, MD. The two-story, 194,845 square foot facility was originally constructed in 1956 and additions were constructed in 1975 and 1991 (six modular's with major renovation performed in 1975 and FY06 CF - Boiler Stack renovation in 2006. The school has nine temporary buildings on the site.

ACCESSIBILITY ISSUES

The path to the main entrance has curb cuts and is wide enough for wheel chair access, but the main entrance doors lack push button wall switches and automatic door openers. More handicap toilet stalls are needed in the gang restrooms. All programs in the facility on both floors are accessible via elevator. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls. The building does not have a basement. The building has a crawl space.

B. SHELL

The superstructure is steel frame and load bearing masonry walls and open web steel joist roof framing.

The exterior enclosure is comprised of brick veneer and exterior metal panels. The exterior enclosure also includes metal windows with fixed frames and hollow metal steel doors. The facility has very few windows. Some windows are operable, but most of them are fixed. The single pane metal windows in the original building and 1975 addition are rusted and difficult to operate. The exterior metal doors in the original building and 1975 addition are original. The exterior doors do not close properly, difficult to operate, and do not seal tightly. The roof is low-slope built-up roof with gravel ballast and flashing. Forty percent of the roof was replaced in 2000, 20% was replaced in 1994, and the rest was replaced in 1990.

C. INTERIORS

Interior partition walls typically include metal panels and painted CMU with glazed block wainscot in the corridors. Interior doors are generally hollow core wood doors with hollow metal frames. Interior fittings in the building include chalk/tack boards, toilet accessories, handrails, and toilet partitions. The chalkboards in most of the classrooms are original. The toilet accessories are original, rusted and stained. Stair construction includes steel risers and treads with tile finishes. There is a metal ladder to access the roof through the roof hatch.

The interior wall finishes are typically painted metal panels, CMU, and drywall. The floor finishes throughout the building are typically vinyl composition tiles (VCT), carpet, and ceramic tiles. The VCT in the corridors, and some classrooms were partially (60%) replaced in 2005 and the remaining was installed in 1975. The carpet in few classrooms on the second floor is old and stained. The carpet in the first floor classrooms was completely replaced in 2005 with VCT, but carpet in the classrooms on the second floor was partially replaced. There are ceramic tile finishes in the restrooms. The overall ceiling finishes are typically suspended acoustical tiles and were partially replaced in 2012.

D. SERVICES**Conveying**

The building has one hydraulic elevator.

Plumbing

The plumbing fixtures are original. Domestic water distribution is copper piping and the sanitary waste system is cast iron. Rain water system is internal with roof drains.

HVAC

Facility Executive Summary

Heating is provided by two gas/oil-fired boilers (replaced 2012). Cooling is supplied by rooftop package units and water cooled chiller (replaced 2012). The cooling system was updated in November 2007. The heating/cooling distribution system is using air handlers, fan coil units, and unit ventilators. Fresh air is supplied by air handling units. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building has a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution (from branch panels) wiring is typically copper. Lighting and branch wiring is typically serving recessed fluorescent fixtures. Illumination is generally inadequate throughout the building. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible and strobe annunciators in interior corridors and appears to comply with ADA requirements. The system is activated by pull stations and smoke detectors and is centrally monitored. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are combined and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by contact devices and is centrally monitored.

Other Electrical Systems: The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings. The cabinets were replaced in the art room in 2012.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 5 out of 287 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The underground fuel oil tank was replaced in 2008. The outdoor track is expected to be replaced by 2013 and the playground equipment was replaced in 2012.

Facility: \High Schools\Gwynn Park High_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems	D3040	Distribution Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$20,930,808 \$1,991,607	\$10,904,951 \$1,037,627	\$31,835,758 \$3,029,234	Necess ary- 2-5 Yrs	Deferred Maintena nce	System needs to be replaced.
	D3060	Controls & Instrumentation	System	Beyond Useful Life	Renew System	1	Ea.	\$181,399	\$94,509	\$275,907	Necess ary- 2-5 Yrs	Deferred Maintena nce	Controls and instrumentation need to be upgraded.
	D3070	Systems Testing & Balancing	System	Beyond Useful Life	Renew System	1	Ea.	\$143,607	\$74,819	\$218,427	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	D5010	Electrical Service/Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$345,791	\$180,157	\$525,949	Necess ary- 2-5 Yrs	Deferred Maintena nce	The system trips.
	D5020	Lighting and Branch Wiring	System	Beyond Useful Life	Renew System	1	Ea.	\$2,600,048	\$1,354,625	\$3,954,673	Necess ary- 2-5 Yrs	Deferred Maintena nce	Illumination appears inadequate throughout.
	D5030	Communications and Security	System	Beyond Useful Life	Renew System	1	Ea.	\$517,742	\$269,744	\$787,486	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	D5090	Other Electrical Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$92,589	\$48,239	\$140,828	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	E1020	Institutional Equipment	System	Beyond Useful Life	Renew System	1	Ea.	\$360,908	\$188,033	\$548,941	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	G2020	Parking Lots	System	Beyond Useful Life	Renew System	1	Ea.	\$451,276	\$235,115	\$686,391	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	B2020	Exterior Windows (Orig. Bldg.)	System	Beyond Useful Life	Renew System	1	Ea.	\$574,429	\$299,278	\$873,707	Necess ary- 2-5 Yrs	Deferred Maintena nce	The single pane metal windows in the original building and the 1975 addition are original, rusted, difficult to operate, and in fair to poor condition.
	B2030	Exterior Doors (Orig. Bldg.)	System	Beyond Useful Life	Renew System	1	Ea.	\$368,466	\$191,971	\$560,437	Necess ary- 2-5 Yrs	Deferred Maintena nce	Exterior doors do not close properly, are difficult to operate, and do not seal tightly. Door hardware is beyond useful life and in fair condition.
	C1030	Fittings	System	Beyond Useful Life	Renew System	1	Ea.	\$546,086	\$284,511	\$830,596	Necess ary- 2-5 Yrs	Deferred Maintena nce	The interior fittings include chalk/tack boards, lockers, toilet accessories, handrails, and toilet partitions. The chalkboard in most of the classrooms is in fair to good condition. The metal toilet partitions are old, original, rusted/stained, and in poor condition. All original toilet accessories are beyond useful life and need to be replaced.

School Board District	1
School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	318,376 S.F.

Year Built:
Last Renovation:
Facility Description:

High Point High School is a three-story, 318,376 square foot facility located on a 38.8-acre site close to I-95 in Beltsville, MD. The original building was constructed in 1954 and additions were constructed in 1957, 1964, 1967, 1977, with Science Renovation (12,758 S.F.) performed in 1997, FY02 Science CR Renovation (1,278 S.F.) performed in 2005, Major Systems Renovation performed in 2006, FY06 CF Steam Traps performed in 2006, FY06 CF - Roof Replacement performed in 2006, and FY07 Science Renovation performed in 2007. The school has four portable/temporary classroom structures.

ACCESSIBILITY ISSUES

The facility is generally not in compliance with ADA requirements. The main entrance appears to be handicap accessible, however, the restroom facilities do not. Signage and fire alarm system do not appear to comply with ADA requirements. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade and concrete footings and foundation walls. The building has a basement and cellar of cast-in-place concrete construction.

B. SHELL

The superstructure is concrete frame. Floor construction is slab on grade and metal pan with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick and stucco over CMU. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically pitched or low-slope with built-up roof and was replaced in 2006. Entrances comply with ADA requirements.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, lockers, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes steel risers and treads with rubber finishes. The interior wall finishes are typically painted CMU or drywall. Floor finishes in common areas are typically terrazzo. Floor finishes in assignable spaces is typically vinyl tile. During the 2008 assessment it was noted According to the A.H.E.R.A. Management Plan, the school contains 140,280 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically suspended acoustical panels.

D. SERVICES
Conveying

Conveying equipment includes one hydraulic elevator that is original.

Plumbing

Fixtures approximately 75% were replaced 2007. Domestic water distribution is copper piping and the sanitary waste system is cast iron. Rain water system is internal and external with both roof drains and scuppers. Domestic hot water is provided by gas hot water heaters.

HVAC

Heating is provided by three boilers. Cooling is supplied by a mixture of window units, roof top units, and air cooled chiller and cooling towers. The heating/cooling distribution system is a mixture of ductwork in the auditorium and 2-pipe system in most of the school. These systems utilize air handlers, radiators, and unit ventilators installed in 2012. Fresh air is supplied by infiltration and air handling units. Ceiling-mounted exhaust fans are installed in bathrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

Facility Executive Summary

The building does not have a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution from branch panels wiring is typically copper and was partially updated. Lighting and branch wiring is typically serving a mixture of recessed, surface-mounted, and pendent-mounted fluorescent and incandescent fixtures. Illumination is generally inadequate in classrooms, hallways, gym, auditorium, and staircases. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors and appears not to comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are combined and include dedicated closets or cabinets that are inadequately secured and cooled. The building does not include an internal security system.

Other Electrical Systems: The building has an emergency generator on the auditorium side.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 4 out of 450 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The underground fuel oil storage tank was replaced in 2008.

Current Repair Cost: \$37,184,262.61

Replacement Cost: \$82,323,279.16

Facility Executive Summary**Facility:** \High Schools\Largo High**Address:** 505 Largo Road, Upper Marlboro, MD 20772**Attributes:**

School Area	HSC
Congressional	4
County Council	6
Historical Building	No
Legislative	25
Original Building	Built in 1970, 185,406 S.F.
School Addition 1	Built in 1974, 58,175 S.F.
School Board District	6
School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	243,581 S.F.

Year Built:
Last Renovation:**Facility Description:**

Largo High School is located on a 40-acre site outside I-495 (Capital Beltway) in the Upper Marlboro, MD. The two-story, 243,581 square foot facility was originally constructed in 1970, with an addition constructed in 1974 and no major renovations performed.

ACCESSIBILITY ISSUES

The main entrance has curb cuts and wide enough doors for wheel chair access but lacks push button wall switches and automatic door openers. Handicap toilet stalls are available in only one gang restroom on the first floor. The facility has three separate wings which are not connected to each other at the second floor with only one wing having elevator access. The programs on the second story of two wings are therefore not handicap accessible. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on the concrete footing and foundation. The building does not have a basement.

B. SHELL

The superstructure is load bearing masonry walls. Roof construction is metal pan with lightweight fill and is resting on open web steel joist roof framing. The exterior enclosure is brick veneer over CMU. Exterior windows are typically aluminum sash with operable single-pane glazing that are rusted, break frequently and lack supports to keep them open, difficult to open, do not seal properly, and water comes in around some windows. Fire exit windows are not available in many classrooms. Few classrooms have exterior exits to the outside. The exterior doors are hollow metal steel doors and metal frames. The facility has a low-slope built up roof with gravel ballast that was replaced in 1996. The 1970 roof (52,140 S.F.) was replaced in 2012.

C. INTERIORS

Interior partition walls typically include painted CMU, gypsum drywalls, and folding metal partition walls. Six folding metal partition walls were replaced in 2007. Interior doors (including fire doors with no fire ratings) are generally solid core wood doors with metal frames. Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. The classrooms have original black-boards that are difficult to write on. The steel framed stairs have ceramic tile floor finishes. There is a metal ladder to access the roof through the roof hatch.

Interior wall finishes are typically painted CMU, gypsum drywalls, and folding metal partitions. The floor finishes throughout the building are typically vinyl asbestos tiles (VAT), vinyl composition tiles (VCT), terrazzo, carpet, and ceramic tiles. There is VAT floor finish in corridors (near multi-purpose room) and classrooms (rooms 103, 110, 118, 237, 241, and 243). There is terrazzo floor in the lobby. There is carpet in the offices and teachers lounge. There is ceramic tile floor finish in the restrooms. The gym floor was replaced in 2012. The overall ceiling finishes are typically suspended acoustical tiles. Some tiles contain asbestos in the front lobby, library, some classrooms, and are stained warped. There is sheetrock ceilings in the restrooms, storage rooms, and mechanical rooms.

The school and the kitchen area need more storage space.

D. SERVICES**Conveying**

Conveying equipment includes one hydraulic elevator.

Plumbing

The plumbing fixtures are mostly original; however, the water closets have been replaced. Domestic water distribution is copper piping and the sanitary waste system is cast iron. Rain water drainage system is internal with roof drains and scuppers. Domestic hot water is provided by a hot water storage tank heated by a steam exchanger from an operating boiler.

HVAC

Facility Executive Summary

Heating is provided by three steam boilers that are gas/oil fired installed in 1970. Cooling is supplied by two absorption steam powered water cooled chillers (one out of service) that are original and very energy inefficient. The cooling towers were replaced in 2002. The heating/cooling distribution system is a 2-pipe system using large penthouse mounted air handlers, fan coil units, fin tube radiators, and unit ventilators. Fresh air is supplied by air handling units. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building has/a fire sprinkler system. Standpipes are included within fire stairs. Fire extinguishers and cabinets are, distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel that is original (1970). Power distribution (from branch panels) wiring is typically copper. Lighting and branch wiring is typically serving recessed, surface-mounted, and pendent-mounted fluorescent fixtures and some incandescent fixtures that were upgraded in 2007. Illumination is generally adequate. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in common spaces and interior corridors, etc., and or do not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 5 out of 272 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The underground fuel oil storage tank was installed in 2007. The outdoor track was replaced in 2012.

Year Built:
Last Renovation:

Facility Description:

Laurel High School is a two-story, 379,024 square foot facility located on a 43.8-acre site close to I-95 in Laurel, Maryland. The original building was constructed in 1961 as an elementary school. The building became Laurel High School in 1965, with the construction of what is now the main building. Other additions were constructed in 1972, 1975 and 1983. In addition, a Science Renovation (2,856 S.F.) was performed in 1997, another Science Renovation (6,100 S.F.) was part of FY2009, an Auditorium addition was completed in 2009, and the Classroom addition was completed in 2010. There is currently a POD Conversion Project which is scheduled to be completed by 2012.

ACCESSIBILITY ISSUES

The facility is not in compliance with ADA requirements. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade with concrete footings and foundation walls. The building has a crawl space of CMU and some of cast in place concrete construction.

B. SHELL

The superstructure is load bearing masonry walls. Floor construction is slab on grade. Roof construction is a built up roof system on concrete. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is low-slope, built-up roof. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior partition wall types typically include painted CMU and glazed block. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes concrete risers and treads with tile finishes. The interior wall finishes are typically painted CMU and glazed block. Floor finishes in common areas is typically ceramic tile, asbestos tile, VCT, carpet, terrazzo, quarry tile, and wood. Floor finishes in assignable spaces is typically asbestos tile, VCT, and carpet. During the 2008 assessment it was noted according to the A.H.E.R.A. Management Plan, the school contains 128,225 square feet of vinyl asbestos tiles. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are suspended acoustical panels.

D. SERVICES**Conveying**

Conveying equipment includes one hydraulic elevator, two stops and four openings.

Plumbing

The plumbing fixtures are original. Domestic water distribution is primarily copper piping and the sanitary waste system is cast iron. Rain water drainage system is internal with roof drains and external with gutters and downspouts. Domestic hot water is provided through an exchange from the boilers to a storage tank. There is an omission of the insulation in one end of the tank, which may have caused a compromise to the entire tank insulation.

HVAC

Facility Executive Summary

Heating is provided by two oil-fired steam to hot water boilers. There is also another oil fired boiler, which is currently out of service. There is a pending PGCPs Maintenance Department Project for boiler replacement and HVAC upgrades. Cooling is supplied by one water cooled chiller, in the penthouse and a roof mounted BAC cooling tower. The heating/cooling distribution system is a 2-pipe system to air handling units, fan coil units, and unit ventilators. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building has a fire sprinkler system only in the latter additions of the Main Building. There is no fire sprinkler system in the annex. Fire extinguishers are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main switchboard with two main switches. There is also a one-section ITE add-on, main switch. Power distribution wiring is typically copper. Lighting is typically fluorescent fixtures in the corridors, pendant tandem open industrial and old style wrap-around fluorescent units in the classrooms, troffers with drop styrene lenses in the cafeteria, and surface round HIDs with wire guards in the gym. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible signal devices in common spaces, interior corridors, etc., and does not comply with ADA requirements. The fire alarm control panel (FACP) is an old Simplex non-addressable, 45 zone system. The system is activated by pull stations and smoke detectors. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are separate and include dedicated closets that are not separately air conditioned. The building includes an internal security system that is actuated by contact, optical or combination devices and is centrally monitored. The PTZ Camera was replaced in 2012.

Other Electrical Systems:

The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings. Some kitchen/food service equipment was replaced/installed in 2012.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site with strip paths to building entrance. The parking lot was redesign and expanded in 2010. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has an underground fuel oil storage tank installed in 1988. There is also a propane tank used only for the portable classrooms and green house. The softball field drainage system and playground equipment was replaced in 2012.

Current Repair Cost: \$40,079,043.94**Replacement Cost:** \$99,310,966.11**FCI:** 40.36%

Report Date: 08 Sep 2012

Facility Executive Summary

Facility: \High Schools\Laurel High\Class Rooms

Address: 8000 Cherry Lane, Laurel, MD 20707

Attributes:

None

General Information:

Function:

High School

Year Built:

2010

Gross Area:

44,441 S.F.

Last Renovation:

Facility Description:

Current Repair Cost: \$0.00

Replacement Cost: \$11,477,013.30

FCI: 0.00%

Facility Executive Summary

Facility: \High Schools\Oxon Hill High**Address:** 6701 Leyte Drive, Oxon Hill, MD 20745**Attributes:**

School Area	HSC
Congressional	4
County Council	8
Historical Building	No
Legislative	26
Original Building	Built in 2013, 254,878 S.F.
School Addition 1	Built in 2004, 32,130 S.F. (Gymnasium)
School Board District	8
School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	287,008 S.F.

Year Built:**Last Renovation:****Facility Description:**

Oxon Hill High School is being replaced with a 287,008 square foot facility located on a 38.5-acre site close to Eastern Avenue NE and US Route 50 in Capitol Heights, MD. The Gym building was constructed in 2004 and is expected to remain as part of the new school construction. The school has been designed to achieve LEED Gold (LEED for Schools rating) and is expected to be completed in 2013.

The cost model for this school is based on the available design drawings and planned construction.

Current Repair Cost: \$290,286.20**Replacement Cost:** \$71,461,114.69**FCI:** 0.41%

School Grade	9th-12th

General Information:

Function:	High School
Gross Area:	304,649 S.F.

Year Built:**Last Renovation:****Facility Description:**

Parkdale High School is a two-story, 307,510 square foot facility located on a 34.9-acre site close to MD Route 295 (Baltimore-Washington Parkway) in Riverdale, MD. The original building was constructed in 1968, with additions constructed in 1970 and 2007 and no major renovations performed, with exception of Science Renovation (6,167 square feet) in 1998, Chiller Replacement in 1999, and FY02 QZAB Windows/Doors/Elevation in 2004. The 2008 additions (10,236 S.F.) are complete and include kitchen/multi-purpose room/cafeteria expansion and a two-story classroom building. Renovation to the school also includes FY2011 Science Lab (6,365 S.F.).

ACCESSIBILITY ISSUES

The main entrance to the facility appears to comply with ADA requirements. The main entrance has curb cuts, wide enough doors for wheel chair access, and push button wall switches and automatic door openers. The facility has two elevators and all the programs in the facility are handicap accessible. ADA upgrades are currently planned.

A. SUBSTRUCTURE

The building typically rests on a slab-on-grade. The building does not have a basement or crawl space.

B. SHELL

The superstructure of the facility is load bearing masonry walls and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over CMU, double pane metal windows with operable frames, and hollow metal steel doors. The metal windows throughout the building were replaced in 2004. The double pane windows are energy efficient. Most of the classrooms have a fire window exits. The exterior doors throughout the building were replaced in 2004; some do not close properly and are difficult to operate. The building has low-slope, built up roof with gravel ballast. The built-up roof was replaced in 2002.

C. INTERIORS

The interior partition walls typically include painted CMU with glazed block wainscot in the corridors, folding metal partitions in a few classrooms, and drywall. The interior doors are generally solid core wood doors with hollow metal frames. Many interior fire doors (60%) and stairway doors were replaced in 2004.

Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. The classrooms have original chalkboards. The toilet accessories, such as metal toilet partitions, were partially replaced (60%) in 2006 and 2007. The facility has ten concrete stair cases (concrete risers and treads with steel frame). The handrails on the stairs have been replaced. There is a metal ladder to access the roof rough the roof hatch.

The interior wall finishes are typically painted CMU, folding metal partitions, and drywall. The floor finishes throughout the building are typically terrazzo, vinyl asbestos tiles (VAT), carpet, and ceramic tiles. There is terrazzo flooring in the corridors in the first. There is VAT floor finishes in the classrooms and in the corridors on the second floor. The VAT in 15 classrooms, including room 250 through 259, 216, and 217, were replaced with VCT. The carpet in a few classrooms (rooms 104, 106, 115, 112, and media center) is stained and worn. There is carpet in the main office. There are ceramic tiles in the restrooms which are stained. During the 2008 assessment it was noted in the A.H.E.R.A. Management Plan that the school contains 79,800 square feet of vinyl asbestos tiles. The overall ceiling finishes are typically suspended acoustical tiles.

D. SERVICES**Conveying**

The building includes two hydraulic elevators, which were repaired in 2004.

Plumbing

The plumbing fixtures are mostly original, even though some new toilets and urinals were recently installed. Sinks, faucets, urinals, toilets, and other plumbing fixtures were partially updated and mostly original. Domestic water distribution is a mixture of copper and galvanized piping. The sanitary waste system is cast iron. Rain water drainage system is internal with roof drains. Domestic hot water is provided by a gas water heater located in the boiler room.

Facility Executive Summary

HVAC

Heating is provided by two original gas/oil fired boilers and also provided by three gas/oil fired steam boilers, which were installed in 2006. Cooling is supplied by a chiller, which was installed in 2001, and a cooling tower, which was installed in 1998. The heating/cooling distribution system is ductwork and a 2-pipe system using radiators and unit ventilators. Fresh air is supplied by infiltration. Ceiling exhaust fans are installed in the restrooms. Controls and instrumentation are a mix of digital and pneumatic and not centrally controlled by an energy management system.

Fire Protection

The building includes a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution wiring is typically copper. Lighting and branch wiring is serving recessed, surface-mounted, and pendent-mounted fluorescent and incandescent fixtures. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible annunciators in common spaces and interior corridors and appears to not comply with ADA requirements. The system is activated by pull stations and is not centrally monitored. The telephone and data systems are combined and not included in dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system equipped with 13 interior and four exterior cameras.

Other Electrical Systems: The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 3 out of 296 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has an underground fuel oil storage tank installed in 2007. The playground equipment was replaced in 2012.

Current Repair Cost: \$23,617,483.00**Replacement Cost:** \$78,872,704.21**FCI:** 29.94%

eCOMET Facility Report Facility Executive Summary

Report Date: 08 Sep 2012

Facility: \High Schools\Parkdale High_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems C1020	Interior Doors	System		Beyond Useful Life	Renew System	1	Ea.	\$15,527,602 \$512,480	\$8,089,881 \$267,002	\$23,617,483 \$779,482	Necessary- 2-5 Yrs	Deferred Maintenance	The interior doors are in fair to poor condition. They do not close properly, have chipped corners and worn surface finishes and are beyond their useful life. The door hardware is in fair condition (hard to lock and unlock).
	C1030	Fittings	System	Beyond Useful Life	Renew System	1	Ea.	\$299,839	\$156,216	\$456,055	Necessary- 2-5 Yrs	Deferred Maintenance	Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. The classrooms have original chalkboards which are beyond useful life and in fair condition. Toilet accessories, such as metal toilet partitions were partially replaced (60%) in 2006/2007 and are in good condition. Remaining toilet accessories are original, beyond useful life, rusted, stained, and in poor condition.
	C3010230	Paint	System	Beyond Useful Life	Renew System	1	Ea.	\$1,083,601	\$564,556	\$1,648,158	Necessary- 2-5 Yrs	Deferred Maintenance	The facility has not been painted for more than five years and the paint is in fair condition (stained and peeling off the walls).
	C3020410	Carpet	System	Beyond Useful Life	Renew System	1	Ea.	\$128,505	\$66,951	\$195,456	Necessary- 2-5 Yrs	Deferred Maintenance	The carpet in a few classrooms 104, 106, 115, 112, and media center is beyond useful life and in fair to poor condition (stained and worn).
	C3020410	VAT (Resilient Flooring)	System	Beyond Useful Life	Renew System	1	Ea.	\$2,003,291	\$1,043,715	\$3,047,006	Necessary- 2-5 Yrs	Deferred Maintenance	The 9x9 vinyl asbestos tile floor finishes in all the classrooms and in the second floor corridors are beyond useful life and in fair to poor condition.
	C3030210	Acoustical Ceilings	System	Beyond Useful Life	Renew System	1	Ea.	\$1,580,783	\$823,588	\$2,404,371	Necessary- 2-5 Yrs	Deferred Maintenance	The acoustical ceiling tiles throughout the building are beyond useful life and in fair condition (stained and warped).
G2020	Parking Lots	System		Beyond Useful Life	Renew System	1	Ea.	\$472,919	\$246,391	\$719,310	Necessary- 2-5 Yrs	Deferred Maintenance	Asphalt surface parking is in poor condition, with cracks, pot holes, and uneven surfaces. There is insufficient parking capacity for the occupants after one of the three parking spaces was demolished due to construction work. Parking striping is worn and is in fair to poor condition.

eCOMET Facility Report

Report Date: 08 Sep 2012

Facility Executive Summary

G2030	Pedestrian Paving	System	Beyond Useful Life	Renew System	1	Ea.	\$36,180	\$18,850	\$55,030	Necess ary- 2-5 Yrs	Deferred Maintena nce	Concrete sidewalks immediately adjacent to the facility are beyond useful life and in fair condition, with cracks and damaged edges. Concrete sidewalks are not present all around the building.
A1010	Standard Foundations	Wall Foundations	Failing	Professional Services- Inpect foundation Walls	1	Each	\$10,171	\$5,299	\$15,471	Potentia lly Critical- 12 months	Building Integrity	Professional services to investigate foundation wall and/or moisture barrier failure. Structural cracks were observed on walls in the boiler room, gymnasium, library, and classrooms that indicate possible settlement or damage to the slab-on-grade.
D2010	Plumbing Fixtures	System	Beyond Useful Life	Renew System	1	Ea.	\$2,083,064	\$1,085,276	\$3,168,340	Necess ary- 2-5 Yrs	Deferred Maintena nce	Plumbing fixtures are mostly original and need update. Some toilets and urinals were updated, while most sinks, faucets, drinking fountains and other plumbing fixtures were not updated. Some were covered with plastic bags to prevent students from using them. Some sinks are chipped, cracked, and have rust. Some faucets are slow and broken.
D2020	Domestic Water Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$147,880	\$77,045	\$224,925	Necess ary- 2-5 Yrs	Deferred Maintena nce	Domestic water lines and equipment are mostly original and have few line leaks and limited capacity.
D2040	Rain Water Drainage	System	Beyond Useful Life	Renew System	1	Ea.	\$160,628	\$83,687	\$244,315	Necess ary- 2-5 Yrs	Deferred Maintena nce	Sanitary piping is beyond useful life, outdated, and some areas are clogged and others are leaking.
D2030	Sanitary Waste	System	Beyond Useful Life	Renew System	1	Ea.	\$226,919	\$118,225	\$345,144	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D3030115	Piping and Misc Equipments	System	Beyond Useful Life	Renew System	1	Ea.	\$2,151,905	\$1,121,142	\$3,273,047	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D3040	Distribution Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$2,730,675	\$1,422,682	\$4,153,357	Necess ary- 2-5 Yrs	Deferred Maintena nce	The distribution system pipes, pumps, ductwork, vents, and units are mostly outdated and beyond useful life. Circulation pumps an pipes are leaking and pipe insulation is peeling off. There are leaks and stains throughout the school.
D5030	Communications and Security	System	Beyond Useful Life	Renew System	1	Ea.	\$708,803	\$369,286	\$1,078,089	Necess ary- 2-5 Yrs	Deferred Maintena nce	The security and communication systems are beyond useful life and in need of update. Other electrical systems are not included in dedicated space and jammed with other materials in small storage room. Some electrical panels have no expanding capacity.
D5090	Other Electrical Systems	System	Beyond Useful Life	Renew System	1	Ea.	\$124,933	\$65,090	\$190,023	Necess ary- 2-5 Yrs	Deferred Maintena nce	
E1020	Institutional Equipment	System	Beyond Useful Life	Renew System	1	Ea.	\$494,632	\$257,703	\$752,335	Necess ary- 2-5 Yrs	Deferred Maintena nce	
G3060110	NG Supply	System	Beyond Useful Life	Renew System	1	Ea.	\$17,848	\$9,299	\$27,146	Necess ary- 2-5 Yrs	Deferred Maintena nce

Facility Description:

Potomac High School is a two-story, 276,838 square foot facility located on a 45.8-acre site close to I-495 (Capital Beltway) in Oxon Hill, MD. The original building was constructed in 1965 and additions were constructed in 1968 and 1981. The air conditioning was upgraded in 1978, a science renovation (county) was conducted in 2003, another science renovation in 2006, the Lecture and Dance addition was completed in 2009, and a new Science Wing was also completed in 2009. In addition, another Science renovation (1,900 S.F.) is being conducted as part of FY2012.

ACCESSIBILITY ISSUES

The main entrance has a ramp, doors wide enough for wheel chair access, and has push button wall switches and automatic door openers. Handicap accessible toilet stalls are available on both floors in the gang restrooms. The school has an elevator and all the programs on the second floor are handicap accessible to the handicapped. In addition, some stairs have a chair lift. ADA upgrades are currently planned.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, or sub-floor. The building has a crawl space that is accessible from the boiler room.

B. SHELL

The superstructure is load bearing masonry walls with slab-on-grade floor and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over CMU, single pane metal windows with operable frames, and hollow core metal doors. All classrooms have fire exit windows. Roof construction is low-slope built-up roof with stone ballast.

C. INTERIORS

Interior partition walls typically include painted CMU with glazed block wainscot in the corridors and few gypsum drywalls. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk/tack boards, lockers, toilet accessories, handrails, and toilet partitions. Most classrooms have the original chalk boards. Metal toilet partitions were completely replaced in 2007. Interior wall finishes are typically painted CMU and drywall. Floor finishes are typically terrazzo, vinyl asbestos tiles (VAT), carpet, and ceramic tile. There is terrazzo flooring in the corridors. All classrooms and kitchens have VAT. There is carpet in the offices. There are ceramic tiles in the restrooms. The overall ceiling finishes are typically suspended acoustical tiles. The acoustical tiles in the hallways were replaced in summer 2007.

D. SERVICES

Conveying

The building includes hydraulic conveying equipment.

Plumbing

The plumbing fixtures are mostly original with the exception of toilets that were installed in 2008. Domestic water distribution is copper and galvanized steel piping and the sanitary waste system is cast iron. Rain water system is internal with roof drains.

HVAC

Heating is provided by three gas/oil-fired boilers updated in October 2007. Cooling is supplied by water cooled chillers and roof-top package units. The heating/cooling distribution system is a 2-pipe system using original fan coil units. Fresh air is supplied by air handling units. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Facility Executive Summary

Fire Protection

The building does not have a full fire sprinkler system; only few areas, such as the custodian closet are sprinkled. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution wiring (from branch panels) is typically copper. Lighting and branch wiring is typically serving suspended fluorescent fixtures. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible and strobe annunciators in interior corridors and is scheduled for update in early 2008. The system is activated by pull stations and smoke detectors and is not centrally monitored. The system needs to be upgraded to comply with current code and ADA requirements. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by contact devices and is centrally monitored with no surveillance.

Other Electrical Systems: The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater, stage and medical equipment. The building also includes fixed casework, window treatment, food service equipment and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where 10 out of 110 are handicap spaces with strip paths to building entrance. Drainage is handled by surface discharge and area drains. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic. The water supply is provided from the municipal distribution system. The school has an underground fuel oil storage tank.

Current Repair Cost: \$34,774,997.60**Replacement Cost:** \$73,428,986.12**FCI:** 47.36%

Facility: \High Schools\Potomac High_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems	B2020	Exterior Windows	System	Beyond Useful Life	Renew System	1	Ea.	\$22,863,246 \$630,390	\$11,911,751 \$328,433	\$34,774,998 \$958,823	Necess ary- 2-5 Yrs	Deferred Maintena nce	Exterior windows are original, difficult to open, not energy efficient, and in fair to poor condition. The flashing and caulking around the windows are damaged. Some windows do not lock properly.
	B2030	Exterior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$405,551	\$211,292	\$616,843	Necess ary- 2-5 Yrs	Deferred Maintena nce	Exterior doors are original, beyond its useful life, and in fair to poor condition, with rusted metal frames. The main entrance doors were replaced recently and are in fair condition. The exterior doors are not easy to operate and they do not seal tightly. The door hardware is in fair condition.
	C1020	Interior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$409,754	\$213,482	\$623,235	Necess ary- 2-5 Yrs	Deferred Maintena nce	Interior doors and are in fair to poor condition; some do not operate properly. The door hardware is in fair condition.
	C3020410	Carpet	System	Beyond Useful Life	Renew System	1	Ea.	\$97,600	\$50,850	\$148,450	Necess ary- 2-5 Yrs	Deferred Maintena nce	The carpet in the offices is old, stained, worn-out, and in poor condition.
	C3020410	VAT (Resilient Flooring)	System	Beyond Useful Life	Renew System	1	Ea.	\$2,076,962	\$1,082,097	\$3,159,059	Necess ary- 2-5 Yrs	Deferred Maintena nce	All of the classrooms and kitchen have 9x9 vinyl asbestos tiles, which are beyond useful life and are in poor condition.
	C3030210	Acoustical Ceilings (Classrooms)	System	Beyond Useful Life	Renew System	1	Ea.	\$938,313	\$488,861	\$1,427,173	Necess ary- 2-5 Yrs	Deferred Maintena nce	Acoustical ceilings in classrooms are old and in fair to poor condition (stained and warped). Acoustical ceilings in the hallways were replaced in 2007 and are in good condition.
	G2020	Parking Lots	System	Beyond Useful Life	Renew System	1	Ea.	\$204,406	\$106,496	\$310,901	Necess ary- 2-5 Yrs	Deferred Maintena nce	Parking lots are in fair to poor condition and has been patched several times in the past, including December 2007. The road surface is in fair condition with some damage, especially on the back side of the building.
	G2030	Pedestrian Paving	System	Beyond Useful Life	Renew System	1	Ea.	\$51,926	\$27,053	\$78,979	Necess ary- 2-5 Yrs	Deferred Maintena nce	Concrete sidewalks immediately adjacent to the facility are beyond useful life and in fair condition.
	D1010	Elevators and Lifts	System	Beyond Useful Life	Renew System	1	Ea.	\$105,065	\$54,739	\$159,804	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	D2020	Domestic Water Distribution	System	Beyond Useful Life	Renew System	1	Ea.	\$117,673	\$61,308	\$178,980	Necess ary- 2-5 Yrs	Deferred Maintena nce	
	D2030	Sanitary Waste	System	Beyond Useful Life	Renew System	1	Ea.	\$182,813	\$95,246	\$278,059	Necess ary- 2-5 Yrs	Deferred Maintena nce

Facility Description:

Suitland High School is a two-story, 344,875 square foot facility located on a 24.5-acre site close to MD Route 458 and MD Route 4 (Pennsylvania Avenue) in Forestville, MD. The original building was constructed in 1951 and additions were constructed in 1964, 1982, and 1983 and 1986 (auditorium) with major renovation performed in 1984, 2007 (FY07 Science Renovation - 7,673 S.F.) and 2008 (FY08 Science Renovation - 7,600 S.F.).

ACCESSIBILITY ISSUES

The entrance has curb cuts and a ramp. The elevator is small and does not comply with ADA guidelines. Interior door hardware is non-compliant. The auditorium and vocational buildings appear to comply with most accessibility guidelines. Further study by an ADA Specialist is required to ensure compliance with both Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade that is showing signs of settlement and damage. The building does not have a basement, cellar or a sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade and in many places the floor is cracked and damaged. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Cracks have been observed in several places on the exterior in closure. Exterior windows are steel sash with operable single-pane glazing. Exterior doors are a combination of hollow metal steel and solid core wood. Partial roof replacements were conducted in 2009 and 2012. Entrances seem to comply with ADA requirements.

C. INTERIORS

Interior partition wall types are typically painted CMU. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Stair construction includes concrete risers and treads with terrazzo finishes. The interior wall finishes are typically paint, and ceramic tiles. The Auditorium was repainted in 2012. Floor finishes in common areas are typically terrazzo, ceramic tile, vinyl composition tile and carpet. Floor finishes in assignable spaces are typically vinyl tile, carpet, wood, and ceramic tiles. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster and suspended acoustical panels.

D. SERVICES

Conveying

The building has a hydraulic elevator that was rebuilt in 2006. The elevator lacks some ADA requirements.

Plumbing

Plumbing fixtures are original. Domestic water distribution is original and consists of copper and galvanized piping in fair condition. Domestic hot water is provided by a gas fired water heaters. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains and there are areas of the roof that lack drainage. The building had a sprinkler system and standpipe system.

HVAC

Facility Executive Summary

Heating is provided by four dual fired steam boilers in two boiler rooms that supply fan coil units, fin tube radiators, air handlers and terminal units throughout the building. In Boiler Room - 2, the boilers were replaced in 2011. Cooling is provided a combination of air cooled chillers, DX split systems, and roof mounted package units. The auditorium has its own air cooled chillers and gas fired boilers. Fresh air is supplied during heating season by outdoor air inlets on the fan coil units. Ventilation during cooling season is provided by the air handling units and by infiltration. Controls are low voltage electrical thermostats, individual controls on window units and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides service to the building. Minor additions have been made to provide power for the vocational wing and computer services. Lighting fixtures in the classrooms are fluorescent lamps, hard ballasts, and light levels are inadequate. There are emergency lights in the corridors and exit signs are properly placed and illuminated. The building has three generators, 150 KW emergency generator and two small units of approximately 10KW in the auditorium and the vocational building.

Communication and Security

The system consists of audible and visual annunciators, manual pull stations, and heat/smoke detectors. The system was replaced in 1995 and appears to meet most ADA requirements. The auditorium fire detection system was being replaced during the time of the assessment. Telephone and data systems are separate, not located in dedicated closets, and do not have independent cooling systems. The security system consists of motion sensors, a limited CCTV system, and is inadequate. The PTZ Camera was replaced in 2012.

E. EQUIPMENT & FURNISHINGS

The building includes fixed furnishings, and medical equipment. The building also includes fixed casework, window treatment, food service equipment, grease trap, floor grilles and mats, multiple seating furnishings. Some food service equipment was installed/replaced in 2012.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site with four out of 197 are handicap spaces. The site includes concrete sidewalks, lighting, utility lines and an underground fuel storage tank with level and leak detection systems replaced in 2007. Drainage is generally handled by surface drainage.

Current Repair Cost: \$42,326,835.98**Replacement Cost:** \$91,376,502.96**FCI:** 46.32%

Report Date: 08 Sep 2012

Facility Executive Summary

Facility: \High Schools\Suitland High\Auditorium

Attributes:

None

General Information:

Function: High School

Year Built: 1984

Gross Area: 20,829 S.F.

Last Renovation:

Facility Description:

Current Repair Cost: \$2,823,199.15

Replacement Cost: \$5,844,439.40

FCI: 48.31%

Facility Executive Summary

Facility: \High Schools\Suitland High\Voc/Tech Building

Attributes:

None

General Information:

Function: High School
Gross Area: 73,852 S.F.

Year Built: 1982
Last Renovation:

Facility Description:

Current Repair Cost: \$11,857,744.25

Replacement Cost: \$19,657,396.56

FCI: 60.32%

Facility Description:

Surrattsville High School is a two-story, 167,322 square foot facility located on a 30-acre site close to MD Route 5 in Clinton, MD. The original building was constructed in 1960 and additions were constructed in 1962, 1984, 1989 (Eight Modular), 1990 (Four Modular), and 2004, with HVAC Upgrade performed in 1997, Science Renovation (6,250 S.F.) performed in 1999 and most recently the Band Room was renovated in 2012.

ACCESSIBILITY ISSUES

This school was designed prior to any consideration for the physically challenged. Some areas will require upgrades in order to be ADA compliant include, but are not limited to, signage, door hardware, drinking fountains, and restrooms. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building has sub-floor of cast in place construction.

B. SHELL

The superstructure is steel frame and load bearing masonry walls. Floor construction is slab on grade and metal pan with lightweight fill. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with fixed and operable single-pane and double pane thermo pane glazing. Exterior doors are hollow metal steel. Roofing is typically flat with built-up roof. Entrances do not comply with ADA requirements.

C. INTERIORS

Interior partition wall types typically include painted CMU. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. Toilet configurations and accessories are inadequate and do not comply with ADA requirements. Stair construction includes steel risers and treads with rubber finishes. Interior wall finishes are typically painted CMU or tile. Floor finishes in common areas are typically terrazzo, vinyl composition tile, and carpet. Floor finishes in assignable spaces is typically vinyl tile. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically suspended acoustical panels.

D. SERVICES**Conveying**

Conveying equipment includes one hydraulic actuated elevator which appears to be ADA compliant.

Plumbing

Domestic water distribution is copper and galvanized steel piping. Sanitary waste system is cast iron. There is a sanitary waste ejector pump system that discharges to the municipal sewer and requires regular maintenance. Domestic hot water is provided by a 670,000 btu/hr gas-fired boiler with circulating pumps. Rain water system is an internal and external combination with roof drains and scuppers.

HVAC

Facility Executive Summary

Heating is provided by two gas fired boilers installed in 1988 with an 8,369,000 btu/hr capacity, supplying heating water to air handlers, fan-coil units and fin-tube radiators throughout the building. There is a 10,000 gallon underground fuel-oil tank and natural gas service adequate for the facility. Cooling is supplied by an innovative ice-storage, air-cooled chiller package installed in 1996 that is not functioning properly. The ice-storage system is reportedly out of service and the chiller plant is reportedly designed to operate during off-peak hours and is inadequate to cool the facility during peak cooling periods. Fresh air is supplied by unit ventilators and air handling units. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic/digital, hybrid and are centrally controlled by an energy management system.

Fire Protection

The building has a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel, which was installed in 1996. Power distribution from branch panels wiring is typically copper 3-wire grounded and is adequate. Lighting and branch wiring is typically 3-wire grounded serving recessed and some surface-mounted fluorescent. Illumination is generally inadequate throughout the facility. Emergency power is supplied by a stand-by generator and lighting is battery powered. Exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors, etc., and do not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are separate and include dedicated spaces, closets or cabinets that are not adequately secured and cooled. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The building has a 75kW emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed furnishings, and medical equipment. The building also includes fixed casework, window treatment, food service equipment, grease trap, floor grilles and mats, multiple seating furnishings. Food service equipment was replaced/installed in 2012.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site with eight out of 200 are handicap spaces. The site includes concrete sidewalks, lighting, utility lines and an underground fuel storage tank with level and leak detection systems replaced in 1996. Drainage is generally handled by surface drainage. The Tennis Courts were replaced in 2012.

Current Repair Cost: \$13,806,534.92**Replacement Cost:** \$44,317,427.04**FCI:** 31.15%

General Information:

Function: High School
Gross Area: 39,361 S.F.

Year Built:
Last Renovation:

Facility Description:

Tall Oaks Vocational High School is a one-story, 39,361 square foot facility located on a 14.2-acre site outside I-495 (Capital Beltway) in the Bowie region of MD. The original building was constructed in 1956, with additions added in 1968 and 1984 and major renovation performed in 1984, when it was converted from an elementary school to a vocational high school. The facility has three temporary buildings on the site.

ACCESSIBILITY ISSUES

Only the main entrance to the facility appears to comply with all ADA requirements. The main entrance has curb cuts (no ramp), wide doors, and push button wall switches / door openers. All the programs in this one-story facility are handicap accessible with an exception of three temporary buildings outside the main building. Handicap toilet stalls are available in two gang restrooms and two dedicated single restrooms in the front lobby. Interior graphic and/or signage for ADA compliance are inadequate and missing in some portions of the building. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on the concrete footings and foundation walls. It is recommended that the facility be further investigated by a structural engineer for building integrity. The building does not have a basement but has a crawl space with no reported water infiltration in the past.

B. SHELL

The superstructure is load bearing masonry walls. Roof construction is metal pan with lightweight fill which rests on open web wooden joist roof framing. The exterior enclosure is brick veneer over CMU with glass block. The exterior windows are aluminum sash with operable thermo-pane glazing. Fire exit windows are available in all the classrooms. The exterior doors are hollow metal steel doors. There are concrete steps to access the boiler room and a metal ladder to access the roof hatch. The roof was replaced in 2012.

C. INTERIORS

Interior partition walls typically include painted CMU and a few gypsum drywalls (in classrooms. Interior doors (including fire doors with no fire ratings) are generally solid core wood doors with metal frames, with chipped corners, worn surface finishes, and damaged hardware, and several doors are difficult to operate due to swelling. Interior fittings include chalk/tack boards, toilet accessories, handrails, and toilet partitions. Most of the classrooms have original blackboards. The metal toilet partitions are original, rusted and stained.

Interior wall finishes are typically painted CMU and gypsum drywalls. The floor finishes throughout the building are typically asbestos tiles (VAT), vinyl composition tiles (VCT), terrazzo, carpet, and ceramic tiles. There is carpet in the main office, teachers lounge, lobby, and one classroom. There is terrazzo floor finish in the corridors. The ceramic tile floor finishes in the restrooms are stained. The overall ceiling finishes are typically needlepoint, fissured, and Tectum acoustical tiles.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

The plumbing fixtures such as urinals, sinks, and toilets, including flush valves, are original, rusted and stained. Domestic water distribution is copper and galvanized steel piping. The facility is on a well system and the water quality is very poor. It is full of sediments, discolored, and has a distinct odor. Sanitary waste system is cast iron piping. The facility is on a septic system. Rain water system is internal with roof drains. Domestic hot water is supplied by a gas water heater with circulating pumps, which was installed in 1997.

HVAC

Facility Executive Summary

Heating is provided by two steam boilers, which were installed in 1999 in the main boiler and two steam boilers with heat exchangers which were installed in 1999 and serve the MPR and office/admin areas. All boilers are gas/oil fired. Cooling is supplied by two sets of dual compressor air cooled chillers. The heating/cooling distribution system is a 4-pipe system using air handlers and fan coil units. Fresh air is supplied by fan/coil units and air handling units. Roof-mounted exhaust fans are installed in restrooms and ventilation is reported as adequate. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. There is an additional 400 amp main panel in the small boiler room that serves the admin/MPR. Power distribution (from branch panels) wiring is typically copper; 3-wire grounded. Lighting and branch wiring is typically 3-wire grounded serving recessed, surface-mounted and pendent-mounted fluorescent with some incandescent. Illumination is generally in adequate throughout the facility. Emergency power and lighting are battery powered and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors, etc., and do not comply with ADA requirements. The system is activated by pull stations and/or smoke detectors and is not centrally monitored. The system needs to be upgraded to comply with current code requirements. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The building has an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed furnishings, and medical equipment. The building also includes fixed casework, window treatment, food service equipment, grease trap, floor grilles and mats, multiple seating furnishings.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site with one out of 45 are handicap spaces. The site includes concrete sidewalks, lighting, utility lines and a 6,000 gallon underground fuel storage tank with level and leak detection systems replaced in 1995. Drainage is generally handled by surface drainage.

Current Repair Cost: \$5,408,510.61

Replacement Cost: \$10,949,017.88

FCI: 49.40%

General Information:

Function:	Elementary School	Year Built:
Gross Area:	38,872 S.F.	Last Renovation:

Facility Description:

Adelphi Elementary School is a one-story, 38,872 square foot facility located on a 14.6-acre site close to MD Route 650 and I-495 (Capital Beltway) in Adelphi, MD. The original building was constructed in 1954 and additions were constructed in 1957 and 1970, with major renovation done in 1970 and 2007.

ACCESSIBILITY ISSUES

Efforts have been made to make this facility handicap accessible. Entrances are handicap accessible. There are renovated and handicap accessible restroom facilities for students and staff throughout the building. In addition, there is up to date signage and fire alert devices installed or in the process of installation. However, further study by an ADA Specialist is required to insure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement.

B. SHELL

The superstructure is steel frame and load bearing stud walls. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with thermo pane glazing, which were installed in 2007. Exterior doors are hollow metal steel. Roofing is typically low-slope with built-up roof.

C. INTERIORS

Interior partition wall types typically include painted CMU and drywall. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, toilet accessories, shelving. The interior wall finishes are typically painted CMU and drywall partitions. Floor finishes in common areas are typically terrazzo and vinyl composition tile. Floor finishes in assignable spaces are typically vinyl tile. During the 2008 Assessment it was noted in the A.H.E.R.A. Management Plan Report, the school contains 20,610 square feet of vinyl asbestos tiles. Ceiling finishes in common areas and assignable areas are typically suspended acoustical panels.

D. SERVICES**Conveying:**

The building does not include conveying equipment.

Plumbing

Fixtures are original. Domestic water distribution is copper and plastic. Sanitary waste system is cast iron and plastic. Rain water system is a mixture of internal and external with roof scuppers. At the time of the November 2007 assessment, the roof was completely rehabilitated, as new.

HVAC

Heating is provided by two steam boilers. The boilers have capability for dual fire, #2 fuel oil and natural gas. HVAC system installation was completed in 2008. Cooling is supplied by rooftop package units and few window units. The heating/cooling distribution system is a ductwork and 2-pipe system using fan coil units and unit ventilators. Fresh air is supplied by infiltration and air handling units. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are digital and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

Facility Executive Summary

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution from branch panel wiring is typically copper. Lighting and branch wiring is typically serving recessed, surface-mounted, and pendent-mounted fluorescent. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe annunciators in common spaces and interior corridors. The system is activated by pull stations and/or smoke detectors and is centrally monitored. The telephone and data systems are combined and include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by optical devices and is centrally monitored.

Other Electrical Systems

During the construction phase, the building did not have a dedicated emergency generator. The whole school was running on a temporary generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, medical equipment and food service equipment. The building also includes fixed casework, window treatment, and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on site where three out of 56 are handicap spaces with path to building entrance. Drainage is generally handled by surface discharge and area drains. The site includes concrete sidewalks immediately adjacent to the facility, site lighting for vehicular and pedestrian night traffic and an underground fuel tank repalced in 1995. The water supply is provided from the municipal distribution system.

Gross Area:	48,686 S.F.	Last Renovation:

Facility Description:

Allenwood Elementary School is a one-story, 48,686 square foot facility located on a 9.7-acre site close to Interstate 495 (Capital Beltway) in Temple Hills, MD. The original building was constructed in 1967 and an addition was constructed in 2000. In 2012 there was a POD conversion of 20,000 S.F. into classrooms.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, sub-floor, cross base or crawl space.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over. With the POD conversion into classrooms performed in 2012 most of the exterior windows and doors were replaced. Roofing is typically a very low slope with built-up roof and standing seam metal.

C. INTERIORS

Interior partition wall types typically include painted CMU, glazed block wall, and moveable wall. With the POD conversion into classrooms performed in 2012 most of the interior doors, paint and fittings were replaced. Interior fittings include chalk and tack boards, graphics, toilet accessories, shelving, and toilet partitions. The interior wall finishes are typically paint, glazed block, ceramic tiles, and moveable wall partitions. Floor finishes in common areas are typically ceramic tile, vinyl composition tile, and carpet. Floor finishes in assignable spaces are typically vinyl tile, carpet and wood. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster and suspended acoustical panels.

D. SERVICES

Conveying

The building does not have an elevator.

Plumbing

Fixtures are original except for the low flow toilets. Domestic water distribution is original and consists of copper and galvanized piping. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building does not have a sprinkler system.

HVAC

Heating is provided by two dual fired boilers that supply fin tube radiators and terminal units throughout the building. With the POD conversion into classrooms performed in 2012 most of the individual window units for each classroom were replaced, cooling is also provided by roof mounted cooling-only package units for the media center and main office. The 2000 classroom building has roof mounted package units that provide both heating and cooling. Fresh air is supplied mostly by infiltration. Controls are low voltage electrical thermostats, individual controls on window units and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pole mounted transformer provides power to a main disconnect. Minor circuit additions have been installed to address the window air conditioner power, but most of the system is original. With the POD conversion into classrooms performed in 2012 most of the lighting has been upgraded. There are battery pack emergency lights in the corridors and illuminated exit signs.

Other Electrical Systems:

The building does not have an emergency generator.

Facility Executive Summary

Communication and Security

The system consists of audible alarms, manual pull stations and heat/smoke detectors. Telephone and data systems are separate, not located in dedicated closets and without independent cooling systems. The security system consists of motion sensors.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage (MPR), and medical equipment. The building also includes fixed casework, window treatment, food service equipment, grease trap, floor grilles and mats, multiple seating furnishings. With the POD conversion into classrooms performed in 2012 most of the Institutional equipment was upgraded.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site where two out of 44 are handicap spaces. The site includes concrete sidewalks, lighting, utility lines and a 10,000 gallon fuel oil tank of dual wall construction with level and leak detection systems replaced in 2007. Drainage is generally handled by surface drainage.

Congressional	4
County Council	8
Historical Building	No
Legislative	26
Original Building	Built in 1967, 44,467 S.F.
School Addition 1	Built in 1998, 7,375 S.F.
School Board District	8
School Grade	PreK-6th

General Information:

Function:	Elementary School
Gross Area:	51,842 S.F.

Year Built:**Last Renovation:****Facility Description:**

Apple Grove Elementary School is a one-story, 51,842 square foot facility located on a 9.1-acre site close to I-495 (Capital Beltway) in Fort Washington, MD. The original building was constructed in 1967 and an addition was constructed in 1998, with no major renovations.

ACCESSIBILITY ISSUES

The building has some ADA compliant features including curb cuts and ramp. Interior door hardware, restrooms and fire detection systems are not ADA compliant. Further study by an ADA Specialist is required to ensure compliance with both Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, or sub-floor.

B. SHELL

The superstructure is steel frame. Floor construction is slab on grade. Roof construction is open web steel joist metal frame and wood panels with lightweight fill. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows in the original building are steel sash with operable single-pane glazing. In the 1988 addition the exterior windows are aluminum sash with operable double-pane glazing, exterior doors are hollow metal steel with hollow metal steel frames and roofing is typically low-slope with built-up roof.

C. INTERIORS

Interior partition wall types typically include painted CMU with glazed block wainscot in corridors. Many classrooms have movable walls partitions. Interior doors are generally solid core with hollow metal frames. Interior fittings include chalk and tack boards, graphics, toilet accessories, shelving, and toilet partitions. The boiler room has stair construction that includes steel treads with painting finish. The interior wall finishes are typically painted CMU and glazed block wainscot. Floor finishes in common areas are vinyl tiles. Floor finishes in assignable spaces are vinyl tile, carpet and wood. Ceiling finishes in common areas are suspended acoustical panels. Ceiling finishes in assignable areas are typically plaster and suspended acoustical panels.

D. SERVICES**Conveying**

The building does not have an elevator.

Plumbing

Fixtures are original except for the low flow water closets. Domestic water distribution is original and consists of copper and galvanized piping. Domestic hot water is provided by a gas fired water heater. Sanitary waste system is cast iron. Rain water drain system is internal with roof drains. The building has sprinkler system in the janitors closets only.

HVAC

Heating is provided by two steam dual fired boilers that supply fin tube radiators and terminal units throughout the building. Cooling is provided by individual window units for each classroom and a roof mounted cooling only package unit for the media center. Heating and cooling for the 1998 classroom addition is provided by roof mounted, gas fired package units. Fresh air is supplied mostly by infiltration. Controls are low voltage electrical thermostats, individual controls on window units and pneumatic. The system is not centrally monitored or controlled.

Electrical

A pad mounted transformer provides a main disconnect. Minor circuit additions have been installed to address the window air conditioner power, but most of the system is original. Lighting in the corridors has been upgraded but classrooms have 40W fluorescent lamps and hard ballasts. There are battery pack emergency lights in the corridors and exit signs are illuminated. The building does not have an emergency generator.

Facility Executive Summary

Communication and Security

The system consists of audible alarms, manual pull stations and heat/smoke detectors. Telephone and data systems are separate, not located in dedicated closets and do not have independent cooling systems. The security system consists of motion sensors.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage (MPR) and medical equipment. The building also includes fixed casework, food service equipment, grease trap and window furnishings.

F. SPECIAL CONSTRUCTION

There are no special construction features in the building.

G. SITE

Parking is available on-site where two out of 26 are handicap spaces. The site includes concrete sidewalks, lighting and utility lines. Drainage is generally handled by surface discharge. Underground fuel tank was replaced in 2009.

Current Repair Cost: \$9,911,548.23**Replacement Cost:** \$14,162,068.86**FCI:** 69.99%

General Information:

Function:	Elementary School
Gross Area:	54,047 S.F.

Year Built:**Last Renovation:****Facility Description:**

Ardmore Elementary School is a one-story, 54,047 square foot facility located on a 9.1-acre site close to Interstate 495 (Capital Beltway) in Springdale, MD. The original building was constructed in 1960 and additions were constructed in 1965, 1967 and 2000, with no major renovations. In 2012 a kitchen grease trap was replaced.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements, with the exception of the 2000 addition. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls and slab-on-grade. The building does not have a basement, cellar, or sub-floor.

B. SHELL

The superstructure is load bearing CMU walls. Floor construction is slab on grade. Roof construction is steel joists and cementitious fiber decking. The exterior enclosure is comprised of walls of brick veneer over CMU. Exterior windows are aluminum sash with fixed and operable single-pane glazing. Exterior doors are hollow metal steel in hollow metal frames. The windows and doors are of the original construction. Roofing is typically low-slope built-up roofing with gravel ballast.

C. INTERIORS

Interior partition wall types are typically painted CMU. Interior doors are generally solid core wood with hollow metal frames. Doors installed in the 1960s buildings have bored lockset hardware. The doors in the 2000 addition are laminated plastic covered solid core wood doors with stainless mortise locksets. Interior fittings include chalk and tack boards, graphics, toilet accessories, shelving, handrails and toilet partitions. The interior wall finishes are typically painted CMU, including restrooms. The corridors and toilets have a glazed finish CMU wainscot. Floor finishes in common areas are vinyl composition tile. Floor finishes in assignable spaces are vinyl asbestos tile and carpet. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically suspended acoustical panels. The 2000 addition has suspended mesh panels. Restrooms have painted drywall ceilings.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Fixtures are original. Domestic water distribution is copper and galvanized steel. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by a gas hot water heater.

HVAC

Heating is provided by two hot water boilers. Cooling is supplied by individual room window units and five roof-top package units. The heating system is a 2-pipe system using air handlers, fin tube radiators, and unit ventilators. Fresh air is supplied by the unit ventilators. Roof-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

Facility Executive Summary

The electrical service is fed from a pad mounted transformer that power to original switchgear. Power distribution from branch panels wiring is typically copper. An additional sub-main was added in 1998 to facilitate the installation of panel boards to service the window A/C units throughout the school. Lighting and branch wiring is serving recessed, surface-mounted and pendent-mounted fluorescent, incandescent. Emergency battery powered lighting is present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible/strobe alarms in common spaces and interior corridors, etc. The system is activated by pull stations and/or smoke detectors and is not centrally monitored. The system is from 1988. The telephone and data systems are separate and do not include dedicated closets or cabinets and are not secured and cooled. The building includes an internal security system that is actuated by combination devices and is centrally monitored.

Other Electrical Systems: The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library and audio-visual equipment. The building also includes fixed casework, window treatment, food service equipment, grease trap interceptor replaced in 2012 and original furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site where two out of 40 are handicap spaces. The site includes concrete sidewalks, lighting for vehicular and pedestrian night traffic, utility lines and a 10,000 gallon fuel oil tank of dual wall construction with level and leak detection systems replaced in 1987. Drainage is generally handled by surface discharge.

Current Repair Cost: \$8,067,270.06**Replacement Cost:** \$15,121,114.15**FCI:** 53.35%

Upper Marlboro, MD 20772

eCOMET Facility Report

Report Date: 08 Sep 2012

Facility Executive Summary

Facility: \Elementary Schools\Ardmore Elementary_Original Building

Attributes:

None

General Information:

Function: Elementary School

Year Built: 1960

Gross Area: 48,923 S.F.

Last Renovation:

Facility Description:

Current Repair Cost: \$7,717,181.19

Replacement Cost: \$13,796,180.53

FCI: 55.94%

Prince George County Public Schools

13300 Old Marlboro Pike

School Board District	7
School Grade	PreK-6th

General Information:

Function: Elementary School
Gross Area: 59,923 S.F.

Year Built:
Last Renovation:

Facility Description:

Arrowhead Elementary School is a one-story, 59,923 square foot facility located on a 10-acre site close to the Interstate 495 (Capital Beltway) in Upper Marlboro, MD. The original building was constructed in 1966 and an addition was constructed in 1978, with no major renovation. In 2009, the interior was repainted and also some minor projects were performed that includes exterior painting, caulking and glass replacement where needed. In 2012, the parking was improved including some minor upgrades with the network infrastructure. In 2013, replacement of most of the distribution system is scheduled.

ACCESSIBILITY ISSUES

Efforts were made to make this one-story facility handicap accessible. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls and slab on grade. The building has a crawl space of CMU construction.

B. SHELL

The superstructure is concrete frame and load bearing CMU walls. Floor construction is metal pan with lightweight fill in original building and slab on grade in a 1978 addition. Roof construction is precast concrete panels. The exterior enclosure is comprised of walls of brick veneer over CMU and precast tilt-up concrete panels. Exterior windows are aluminum sash with operable single-pane glazing. Exterior doors are hollow metal steel. Roofing is typically low-slope with built-up roof.

C. INTERIORS

Interior partition wall types typically include painted CMU, ceramic tile wainscot in the corridors, and drywall. Interior doors are generally solid core with hollow metal frames. Interior fittings include chalk and tack boards and graphics, toilet accessories, toilet partitions and handrails. There is a small steel staircase in boiler room. Interior wall finishes are typically painted concrete, CMU and drywall, and ceramic tile. In 2009 the interior was repainted. Floor finishes in common areas of the original building are vinyl asbestos tiles. Floor finishes in common areas of the 1978 addition are vinyl composition tiles. Floor finishes in assignable spaces of the original building are vinyl asbestos tiles and carpet. The floor finish in the kitchen is ceramic tile. Ceiling finishes in common areas are typically suspended acoustical panels. Ceiling finishes in assignable areas are typically suspended acoustical panels and Tectum panels. Ceiling in gymnasium and special education area consists of Tectum panels.

D. SERVICES

Conveying

The building does not include conveying equipment.

Plumbing

Sinks, faucets, and other plumbing fixtures are original, but urinals and low flow toilets were installed 2007. Most of the water fountains are original. Domestic water distribution is mostly copper. Sanitary waste system is cast iron. Rain water system is internal and external with roof drains and scuppers. Domestic hot water is provided by gas hot water heater.

HVAC

Heating is provided by two gas/oil fired Boilers. Cooling is supplied by window and roof top units. The heating/cooling distribution system is a ductwork and direct for cooling and 2-pipe for heating system using air handlers and unit ventilators. Fresh air is supplied by infiltration and air handling units. Most of the air handling units are original. Ceiling exhaust vents are in bathrooms. Controls and instrumentation are pneumatic not centrally controlled by an energy management system. Most of the distribution system is scheduled for replacement in 2013.

Fire Protection

Facility Executive Summary

The building has 5% fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution wiring is typically copper. The switch gear is original. Lighting and branch wiring is serving recessed, surface-mounted, and pendent-mounted fluorescent and incandescent. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible alarms in common spaces and interior corridors. The system is activated by pull stations and is not centrally monitored. The telephone and data systems are combined, they do not include dedicated closets or cabinets and are not secured or cooled. The building includes an internal security system that is actuated by optical and contact devices and is centrally monitored.

Other Electrical Systems:

The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library equipment, theater, stage, medical equipment and detention equipment. The building also includes fixed casework, window treatment, food service equipment, grease trap, floor grilles, mats, and multiple seating furnishings.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking is available on-site where it was improved in 2012 with 109 parking spaces. Signs and procedures are in place for student drop off and pick up. There are only two area drains servicing all paved areas; one in front and one in back of school. Drainage is handled by surface discharge and area drains. The site also includes concrete sidewalks immediately adjacent to the facility area, lighting, utility lines and an 8,000 gallon fuel oil tank replaced in 2000.

Current Repair Cost: \$8,720,715.70**Replacement Cost:** \$16,004,452.80**FCI:** 54.49%

C1030	Fittings	System	Beyond Useful Life	Renew System		1	Ea.	\$176,773	\$92,099	\$268,872	Potentia lly Critical- 12 months	Deferred Maintena nce	The toilet partitions are old and rusty.
C3010230	Tile	System	Beyond Useful Life	Renew System		1	Ea.	\$71,191	\$37,090	\$108,281	Necess ary- 2-5 Yrs	Deferred Maintena nce	
C3020410	VCT	System	Beyond Useful Life	Renew System		1	Ea.	\$140,126	\$73,006	\$213,132	Necess ary- 2-5 Yrs	Deferred Maintena nce	
C3020410	Carpet	System	Beyond Useful Life	Renew System		1	Ea.	\$15,160	\$7,898	\$23,058	Necess ary- 2-5 Yrs	Deferred Maintena nce	
C3020410	Vinyl Asbestos Tile	System	Beyond Useful Life	Renew System		1	Ea.	\$625,906	\$326,097	\$952,004	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D2020	Domestic Water Distribution	System	Beyond Useful Life	Renew System		1	Ea.	\$35,355	\$18,420	\$53,774	Necess ary- 2-5 Yrs	Deferred Maintena nce	Domestic water distribution system is mostly original and appears to be inadequate. Some pipes show signs of leak others have no insulation and other are copper.
D2040	Rain Water Drainage	System	Beyond Useful Life	Renew System		1	Ea.	\$37,751	\$19,669	\$57,420	Necess ary- 2-5 Yrs	Deferred Maintena nce	
D2030	Sanitary Waste	System	Beyond Useful Life	Renew System		1	Ea.	\$53,331	\$27,786	\$81,117	Necess ary- 2-5 Yrs	Deferred Maintena nce	The plumbing fixers, toilets and urinals, are mostly new and were installed in 2007. On the other hand, their sanitary waste and piping is still original the same applies for sinks, water fountains, and faucets.
D3050	Terminal & Package Units	System	Beyond Useful Life	Renew System		1	Ea.	\$1,587,960	\$827,327	\$2,415,286	Necess ary- 2-5 Yrs	Deferred Maintena nce	Almost all of the window units, unit ventilators, air handling units, and other units are original or beyond useful life. Some of the roof top units have control problem and leaking and rusted out. The air handles have few leaks in the ceiling and in the around the condensation lines because of deteriorating insulation.

Facility Executive Summary

Facility: \Elementary Schools\Avalon Elementary**Address:** 7302 Webster Lane, Fort Washington, MD 20744**Attributes:**

School Area	2
Congressional	4
County Council	8
Historical Building	No
Legislative	26
Original Building	Built in 2013, 60,520 S.F.
School Board District	8
School Grade	PreK-6th

General Information:

Function:	Elementary School
Gross Area:	60,520 S.F.

Year Built:**Last Renovation:****Facility Description:**

The new Avalon Elementary School replaces the original building that was recently demolished to make room for the new construction scheduled to be completed in 2013. The new 60,520 S.F. single-story facility is located on an 11.3-acre site close to the I-495 (Capital Beltway) in Fort Washington, MD and has been designed to achieve LEED Gold (LEED for Schools rating).

The cost model for this school is based on the available design drawings and planned construction.

Current Repair Cost: \$0.00**Replacement Cost:** \$16,026,281.59**FCI:** 0.00%

Year Built:
Last Renovation:

Facility Description:

Baden Elementary School is a one-story, 56,625 square foot facility located on a 19.6-acre site close to US Route 301 in Brandywine, MD. The original building was constructed in 1969 and no additions were constructed or major renovations performed since that time. In 2012 some minor work was performed to remove asbestos ceiling tiles. In 2013 the exterior doors are scheduled for replacement.

ACCESSIBILITY ISSUES

The main entrance to the facility is handicap accessible. The main entrance has ramp and doors wide enough for wheelchair access. Handicap toilet stalls are available in two gang restrooms for both boys and girls. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade. The building does not have a basement, cellar, sub-floor, or crawl space.

B. SHELL

The superstructure is load bearing masonry walls, slab-on-grade floor, and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over CMU, single pane metal windows with operable frames, and hollow metal steel doors. The exterior is brick veneer. The metal windows throughout the building are original. The exterior doors throughout the building are scheduled for replacement in 2013. Roof construction is low-slope built-up roof with stone ballast and flashing.

C. INTERIORS

Interior partition wall types typically include painted CMU, glazed block wainscot in the corridors, and folding metal partition panels in four classrooms. The interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk/tack boards, toilet accessories, handrails, and toilet partitions. Stair construction includes concrete risers and treads with steel frame and rubber floor finishes. The stair is located in the gymnasium to access second floor. A steel ladder is available in storage room for access to the roof hatch.

The interior wall finishes are typically painted CMU and painted folding metal panels. Floor finishes are typically vinyl asbestos tiles in corridors and classrooms, with exception of three classrooms, which have been replaced with vinyl composition tiles. There is carpet in offices and library. The floor finishes in restrooms are typically ceramic tiles. The overall ceiling finishes are typically suspended acoustical panels.

D. SERVICES

Conveying

The building does not have an elevator.

Plumbing

Toilets are low-flow, sinks and urinals are original. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal and external combination with roof drains in fair condition.

HVAC

Two original oil-fired boilers provide heating. The cooling tower and chiller provide cooling to the entire building except the gymnasium and clinic, and is delivered by fan coil units and air-handling units. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad-mounted transformer that power to a main panel. Power distribution from branch panels wiring is typically copper. Lighting and branch wiring is typically serving 90% suspended-mounted, 8% recessed, and 2% surface-mounted fluorescents. Emergency power and lighting are not present and exit signs are present at exit doors.

Communications and Security

Facility Executive Summary

The fire alarm system consists of audible enunciators only. The system is activated by pull stations and smoke/heat detectors and heat detectors in most storage rooms, and is centrally monitored. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building does include an internal security system that is actuated by contact devices and is centrally monitored.

Other Electrical Systems: The building does not have a generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, and medical equipment. The building also includes fixed casework/cabinetry, window treatment, food service equipment, grease trap and multiple seating furnishings. The classroom sinks and cabinets are original. The metal window blinds are original.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Asphalt surface parking is available on-site where three handicap spaces out of total 70 parking spaces. The path (ramp) to the building entrance appears to comply with ADA requirements. The site includes concrete sidewalks, lighting and utility lines. Drainage is generally handled by surface discharge. Underground fuel tank was replaced in 1995.

Current Repair Cost: \$8,888,392.31**Replacement Cost:** \$15,870,175.10**FCI:** 56.01%

General Information:

Function: Elementary School

Gross Area: 54,726 S.F.

Year Built:**Last Renovation:****Facility Description:**

Barnaby Manor Elementary School is a one-story, 54,726 square foot facility located on a 9.3-acre site close to Interstate 495 (Capital Beltway) in Oxon Hill, MD. The original building was constructed in 1964 and additions were constructed in 1991 and 2000, with no major renovation performed. In 2012 some minor projects were performed to remove asbestos ceiling tiles and to the network infrastructure.

ACCESSIBILITY ISSUES

All programs in this one-story facility are handicap accessible. The main entrance has curb cuts, a ramp, and wide enough doors. Handicap accessible toilet stalls are available throughout the building. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on a slab-on-grade. The building does not have a basement, but does have a crawl space with water infiltration reported in the past.

B. SHELL

The superstructure of the original building is load bearing masonry walls with slab-on-grade floor and open web steel joist roof framing. Both additions are steel framed structures. The exterior enclosure is comprised of brick veneer over CMU, single and double-pane metal windows, and hollow metal steel doors. The exterior has brick veneer. Exterior windows in the original building have operable, single-pane glazing. Exterior windows in the additions have operable, double-pane glazing. All classrooms in the additions have fire window exits.

Exterior doors are original including door hardware. Roofing on the original building and the 2000 addition is low-slope built-up roof, with gravel ballast. The roof on the 1991 addition is single-ply rubber membrane.

C. INTERIORS

Interior partition wall types in the original building typically include painted CMU with glazed block wainscot in the corridors. Interior partition wall types in the 1991 addition are laminated gypsum board. Interior partition wall types in the 2000 addition are painted CMU. Interior doors throughout the building are generally solid core wood doors with hollow metal frames. Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet accessories. Most of the classrooms have original chalkboards. Toilet accessories such as metal toilet partitions are original. The facility has a metal ladder to access the roof hatch.

Interior wall finishes are typically painted CMU. Floor finishes throughout the building are typically vinyl asbestos tiles, vinyl composition tiles, carpet, and ceramic tiles. The overall ceiling finishes are typically suspended perforated acoustical tiles.

D. SERVICES**Plumbing**

Toilets and flush valves are low-flow, sinks and urinals are original. Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal and external with roof drains.

HVAC

Heating is provided by two gas-fired boilers. Cooling is supplied by temporary window units. The heating/cooling distribution system is a 2-pipe system using air handlers, fin tube radiators, and unit ventilators. Fresh air is supplied by air handling units in the cafeteria and by infiltration elsewhere. Ceiling-mounted exhaust fans are installed in restrooms. Controls and instrumentation are pneumatic and are not centrally controlled by an energy management system.

Fire Protection

The building has a minimal fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Facility Executive Summary

Electrical

The electrical service is fed from a pad mounted transformer that delivers power to a main panel. Power distribution (from branch panels) wiring is typically copper. Lighting and branch wiring is typically serving recessed fluorescent. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible alarms in interior corridors. The system is activated by pull stations and is centrally monitored. The telephone and data systems are separate and do not include dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system that is actuated by contact devices and is centrally monitored, without surveillance.

Other Electrical Systems:

The building does not have emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes library, theater and stage, and medical equipment. The library has shelves and furniture; such as tables and chairs. The nurse's room has beds, sinks and the fixtures in the attached restrooms. The school has a stage with lights and curtains. The building also includes fixed casework/cabinetry in the classrooms, window treatment, food service equipment, grease trap and multiple seating furnishings (folding chairs and tables) in cafeteria.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Asphalt surface parking is available on-site where there is one handicap spaces out of total 49 parking spaces. Drainage is generally handled by surface discharge. The site includes concrete sidewalks, lighting and utility lines. Underground fuel tank was replaced in 1994.

Current Repair Cost: \$8,900,939.62**Replacement Cost:** \$15,064,951.11**FCI:** 59.08%

Facility Executive Summary

Facility: \Elementary Schools\Barnaby Manor Elementary_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems B2020		Exterior Windows	System	Beyond Useful Life	Renew System	1	Ea.	\$5,231,665 \$108,456	\$2,725,698 \$56,506	\$7,957,363 \$164,962	Necess ary- 2-5 Yrs	Deferred Maintena nce	The single-pane metal windows throughout the original building are beyond useful life and in poor condition (damaged). No leaks were reported through windows. The flashing and caulking around the windows are in fair condition. The double-pane metal windows in the additions are in fair to good condition.
	B2030	Exterior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$74,125	\$38,619	\$112,744	Necess ary- 2-5 Yrs	Deferred Maintena nce	The exterior doors throughout the original building are beyond useful life and in fair to poor condition (difficult to operate and do not seal tightly). The door hardware is beyond useful life and in fair condition. The exterior doors in the additions are in fair to good condition.
	C1020	Interior Doors	System	Beyond Useful Life	Renew System	1	Ea.	\$75,295	\$39,229	\$114,524	Necess ary- 2-5 Yrs	Deferred Maintena nce	Interior doors and door hardware in the original building are in fair to poor condition (worn surfaces, chipped corners, and difficult to operate). The interior doors and door hardware in the additions are in fair to good condition.
	C1030	Fittings	System	Beyond Useful Life	Renew System	1	Ea.	\$109,627	\$57,115	\$166,742	Necess ary- 2-5 Yrs	Deferred Maintena nce	Interior fittings include old chalk/tack boards, toilet accessories, handrails, and toilet partitions. Most of the classrooms have original chalkboards that are in fair condition. Metal toilet partitions are original, rusted/stained, and in poor condition in the original building. Toilet accessories in the 1991 and 2000 additions are in fair condition.
	C3010230	Paint	System	Beyond Useful Life	Renew System	1	Ea.	\$151,013	\$78,678	\$229,691	Necess ary- 2-5 Yrs	Deferred Maintena nce	The interior walls in the original building are stained and need to be repainted.
	C3020410	Carpet	System	Beyond Useful Life	Renew System	1	Ea.	\$9,680	\$5,043	\$14,723	Necess ary- 2-5 Yrs	Deferred Maintena nce	The carpets in the classrooms of the 1991 addition are beyond useful life and in fair to poor condition (worn and stained).
	C3030	Ceiling Finishes	System	Beyond Useful Life	Renew System	1	Ea.	\$232,517	\$121,142	\$353,659	Necess ary- 2-5 Yrs	Deferred Maintena nce	The acoustical ceiling tiles in the original building and 1991 addition are beyond useful life and in fair to poor condition (stained).

General Information:

Function:	Elementary School
Gross Area:	26,742 S.F.

Year Built:
Last Renovation:**Facility Description:**

Beacon Heights Elementary School is a one-story, 26,742 square foot facility located on an 8.7-acre site close to I-295 in Riverdale, MD. The original building was constructed in 1965, with no additions constructed or major renovations performed since that time. The boilers are scheduled for replacement in 2013 as well some minor projects including asbestos abatement, water heater, storage tank, underground fuel tank, air compressor, interior painting and lighting of the boiler room.

ACCESSIBILITY ISSUES

The facility is not generally in compliance with ADA requirements. However, further study by an ADA Specialist is required to ensure compliance with Federal and State requirements. The study should include ramp access, interior signage, drinking fountains, fire alarm system, and door hardware.

A. SUBSTRUCTURE

The building typically rests on slab-on-grade and concrete footings and foundation walls. The building has a crawl space of cast in place concrete construction.

B. SHELL

The superstructure is load bearing masonry walls. Floor construction is slab on grade. Roof construction is metal pan with lightweight fill on built up roof system. The exterior enclosure is comprised of walls of brick veneer over CMU. Windows are aluminum sash with operable single-pane glazing. Exterior doors are hollow metal steel with hollow metal frames. Interior doors are solid core wood, with hollow metal frames. Roofing is typically low-slope with built-up roof.

C. INTERIORS

Interior construction partition wall types typically include painted CMU and glazed block. Interior doors are generally solid core wood doors with hollow metal frames. Interior fittings include chalk and tack boards, graphics, lockers, toilet accessories, shelving, handrails and toilet partitions. The interior wall finishes are typically CMU and glaze block. Floor finishes in common areas is typically vinyl asbestos tile, VCT, carpet and ceramic tile. Ceiling finishes in common and assignable areas are typically suspended acoustical tile.

D. SERVICES**Conveying**

The building does not include conveying equipment.

Plumbing

Domestic water distribution is copper. Sanitary waste system is cast iron. Rain water system is internal with roof drains. Domestic hot water is provided by a gas fired hot water generator, and remote storage tank.

HVAC

Heating is provided by two oil-fired hot water boilers scheduled for replacement in 2013. Cooling is supplied by window units. The heating distribution system is a 2-pipe system to unit ventilators. Ceiling-mounted exhaust grilles are installed in restrooms to roof mounted exhaust fans. Controls and instrumentation are pneumatic, in fair condition, and are not centrally controlled by an energy management system.

Fire Protection

The building does not have a fire sprinkler system. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from an underground vaulted utility transformer that delivers power to a main switch and distribution board. Power distribution wiring is typically copper. Lighting is typically fluorescent lay-in in the corridors and pendant wrap-around units in the classrooms. The school lighting are retrofitted T-8 lighting fixtures. The exterior parking and roadway lighting consists of twin bracket mounted luminaries on steel poles and concrete bases. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

Facility Executive Summary

The fire alarm system consists of audible alarm devices in common spaces, interior corridors, etc. The fire alarm control panel is original. The system is activated by pull stations and smoke detectors. The telephone and data systems are separate and include dedicated closets or cabinets. The building includes an internal security system that is actuated by contact, optical or combination devices and is centrally monitored.

Other Electrical Systems:

The building does not have an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, audio-visual, health room equipment. The building also includes fixed casework, window treatment, food service equipment, grease trap, floor grilles and mats.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Surface parking spaces available on-site where one out of 48 is handicap spaces and paths to building entrances appear to comply with ADA requirements. Drainage is generally handled by surface discharge. The site includes concrete sidewalks, lighting, utility lines and a 10,000 gallon underground fuel oil tank scheduled for replacement in 2013.

Current Repair Cost: \$3,251,898.09**Replacement Cost:** \$7,381,180.21**FCI:** 44.06%

General Information:

Function:	Elementary School
Gross Area:	45,387 S.F.

Year Built:

Last Renovation:

Facility Description:

Berwyn Heights Elementary School is a one-story, 45,387 square foot facility located on a 10.4-acre site close to MD Route 193, I-95, and MD 295 (Baltimore-Washington Parkway) in Berwyn Heights, MD. The original building was constructed in 1958 and additions were constructed in 1962, 1964 and 2002. The school was closed in 2001 and it was reopened in 2002, after complete renovation. In 2012 some minor upgrades were performed to the security system.

ACCESSIBILITY ISSUES

The main entrance has curb cuts, is wide enough for wheel chair access, and has push button wall switches and automatic door openers for handicap access. Handicap toilet stalls configurations and accessories are located in the gang restrooms. Interior graphics and/or signage comply with ADA requirements. The facility is split-level, single story and has ramps to access the different levels. All the programs in the facility are accessible to the handicap or disabled person. Further study by an ADA Specialist is required to ensure compliance with Federal and State requirements.

A. SUBSTRUCTURE

The building typically rests on concrete footings and foundation walls. The building does not have a basement, cellar, or sub-floor. The building does have a crawl space.

B. SHELL

The superstructure is load bearing masonry walls with slab-on-grade floor and open web steel joist roof framing. The exterior enclosure is comprised of brick veneer over CMU, double pane metal windows with operable frames, and hollow metal steel doors. The double pane windows are energy efficient. Only two classrooms have exterior door openings. The original building has low-slope, built up roof with gravel ballast and a metal sloped roof for multi-purpose room.

C. INTERIORS

Interior partition wall types typically include painted CMU with glazed block wainscot in the corridors and drywall. The interior doors, including fire doors, are generally solid core wood door with hollow metal frames. Interior fittings include old chalk/tack boards, toilet accessories, handrails, and metal toilet partitions. The classrooms have original chalkboards and new electronic white boards. The facility has a metal ladder to access the roof hatch.

Interior wall finishes are typically painted CMU and drywall. The floor finishes throughout the building are typically vinyl composition tiles (VCT), terrazzo, and ceramic tiles. The corridors and classrooms finish is VCT. The terrazzo and vinyl sheet floor finish is in the restrooms. The overall ceiling finishes are typically suspended acoustical tiles.

D. SERVICES

Conveying

The building does not include conveying equipment.

Plumbing

Sinks, faucets, toilets and other plumbing fixtures are low-flow. Domestic water distribution is primarily copper. Sanitary waste system is cast iron. Rain water system is internal and external with roof drains. Domestic hot water is provided by gas hot water heater.

HVAC

Heating is provided by oil/gas-fired boilers. Cooling is supplied by rooftop package units. The heating/cooling distribution system is a ductwork and direct for cooling and 2-pipe for heating system using air handlers and unit ventilators. Fresh air is supplied by air handling units. Ceiling-mounted exhaust fans are installed. Controls and instrumentation are mostly pneumatic and digital and are centrally controlled and balanced by an energy management system.

Fire Protection

Facility Executive Summary

The building has fire sprinkler system. Standpipes are not included within fire stairs. Fire extinguishers and cabinets are distributed near fire exits and corridors.

Electrical

The electrical service is fed from a pad-mounted transformer that delivers power to a main panel. Power distribution wiring is typically copper. Lighting and branch wiring is serving recessed fluorescent. Emergency power and lighting are present and exit signs are present at exit doors and near stairways and are typically illuminated.

Communications and Security

The fire alarm system consists of audible and strobe alarms in common spaces and interior corridors. The system is activated by pull stations, smoke detectors and is centrally monitored. The telephone and data systems are separated and are not included in dedicated closets or cabinets that are adequately secured and cooled. The building includes an internal security system (no cameras), that is actuated by contact devices and is centrally monitored.

Other Electrical Systems:

The building has dedicated grounding for lighting protection and an emergency generator.

E. EQUIPMENT & FURNISHINGS

The building includes fixed library, theater and stage, and medical equipment. The library has shelves and furniture, such as tables and chairs. The nurse's room has three beds. The school has a stage with lights and curtains. The building also includes fixed casework/cabinetry in the classrooms, window treatment, food service equipment, grease trap and multiple seating furnishings (folding chairs and tables) in the multi-purpose room.

F. SPECIAL CONSTRUCTION

The building does not include special construction.

G. SITE

Asphalt surface parking is available on-site where there are seven reserved handicap spaces out of total 90 parking spaces. Drainage is generally handled by surface discharge. The site includes concrete sidewalks, lighting and utility lines.

Current Repair Cost: \$1,647,628.50**Replacement Cost:** \$12,346,634.56**FCI:** 13.34%

Function: Elementary School

Year Built: 1958

Gross Area: 35,620 S.F.

Last Renovation: 2002

Facility Description:

Current Repair Cost: \$1,475,823.03

Replacement Cost: \$9,821,114.13

FCI: 15.03%

Prince George County Public Schools

13300 Old Marlboro Pike

eCOMET Facility Report

Facility Executive Summary

Report Date: 08 Sep 2012

Facility: \Elementary Schools\Berwyn Heights Elementary_Building (continued)

Deficiency Detail:

Facility Name	Assembly	System	Material	Distress	Correction	Qty	Unit	Raw Cost	Additional Cost	Total Cost	Priority	Def. Cat.	Note
Building Systems C3030	Ceiling Finishes	System		Beyond Useful Life	Renew System	1	Ea.	\$970,298 \$230,461	\$505,525 \$120,070	\$1,475,823 \$350,532	Necess ary- 2-5 Yrs	Deferred Maintena nce	The overall ceiling finishes are typically suspended 2x2 and 2x4 acoustical tiles (Tectum). The acoustical ceiling tiles in the corridor connecting school with community center are stained and in poor condition.
D2020	Domestic Water Distribution	System		Beyond Useful Life	Renew System	1	Ea.	\$20,660	\$10,764	\$31,423	Necess ary- 2-5 Yrs	Deferred Maintena nce	Domestic water distribution is primarily copper and is in fair condition due to aging.
D2040	Rain Water Drainage	System		Beyond Useful Life	Renew System	1	Ea.	\$22,441	\$11,692	\$34,132	Necess ary- 2-5 Yrs	Deferred Maintena nce	Rain water system is internal and external with roof drains in fair condition.
